Consulting Project: Report 4

Design and Implementation of a Data Warehouse for a Retail Store

Group# 6

Anushree Tak, Pranjal Gururani, Sumeer Angra

Primary Email: anushree_tak@tamu.edu

TEXAS A&M UNIVERSITY AT COLLEGE STATION

Credentials for access to Data warehouse, Reporting and Analysis Services and Report Server

SQL Server Authentication details are as below:

Server name: **infodata16.mbs.tamu.edu**
User id: **gu5127**
Password: **Mays5127**

The above credentials will provide a user access to the following:

1) Database Engine:

Staging area: **602Group6_stagingDB**
Data warehouse area: **602Group6_DW_Area**

2) SSAS:

Cubes deployed for SSAS:
Question 2 **602Group6_HyperCube_Q2**
Question 5 **602Group6_HyperCube_Q5**

3) Report Server: <http://infodata16.mbs.tamu.edu/reportserver>

Project folder: **602_Group6_ProjectReport**

1 Introduction

Data warehouse is a collection of subject-specific and time-variant data that can be used for making important business decisions. It aims at providing data for reporting and analysis purposes and helps with planning, problem solving, and decision support. Data warehouse gets its data from OLTP databases. It contains data from disparate sources which is both current and historic in nature and is used for strategic decision making. The stored data reveals multi-dimensional view of business activities.

Data warehousing is the process of designing data warehouse. It includes fetching data from different sources and storing it in the Staging area. Data in the staging area is cleaned using various methods to remove the data inconsistencies. Clean data is then loaded into the data warehouse and can be then used for reporting and analysis.

The data warehouse being designed for this project is for Dominick's Finer Food (DFF). DFF is a retail business in Chicago area which deals with the sale of grocery. At one point, DFF had a chain of 99 stores spread across Chicago and suburbs, northwest Indiana and Wisconsin. It was first set up in 1918 and had to shut down by 2014 due to continuous fall in revenue. Strategic analysis is important to understand the lack of sales for DFF and the overall poor performance.

As a part of this project, a data warehouse will be designed for DFF to help integrate data across stores and improve its sales, revenue, profit and customer base. The data being used for this project was generated by partnership between Chicago Booth and DFF for a store-level research. The data will be carefully studied, cleaned and stored in the data warehouse to perform analytical reports and solve business questions that could help DFF improve sales, efficiency and customer base.

1.1 Challenges Faced

Every project has to deal with a lot of challenges during its lifetime. The challenges faced during the implementation of this project are:

1. The data was huge, so team had to spend a lot of time in understanding the data and the relationship between various data files.
2. The data was dirty and had a lot of missing values and inconsistencies making it difficult to analyze and draw conclusions. For example, in CCount data files many values are negative for Week column.
3. The file format for data was not uniform. The data files are in csv, txt or HTML format so it took some time to convert data in Excel format for analysis.
4. Deciding on the Business Questions and prioritizing them was challenging because it required in depth understanding of the business and its problems.

1.2 Understanding of the Data

The partnership between Chicago Booth and DFF for research between 1989 and 1994, resulted in store-level scanner data. Spread over 100 stores, the data takes into account 3500 products (UPCs) which belong to 29 different categories.

The Dominick's database contains 2 types of files: files containing details of a particular category, and files containing general details. Details about the data files are as follows:

- a. Customer Count Files
 - The customer count files consist of customer counts for each day for every store. It has the data for customer visits and purchase.
 - This file contains sales data for different products and also coupon redemption per day per store.
- b. Store-specific Demographics
 - The Demographic file contains demographic data related to each store. The U.S. government census data for Chicago area was processed by Market Metrics to create demographic data specific to DFF store.
 - This data provides information about percentage of people in various age groups, ethnicity, sex, shopping style, employment, income, household size, etc. It will help in understanding the customer base and deciding the target customer.
- c. UPC Files
 - This data file has information regarding the UPC associated with different categories.
 - This contains data about Product Name, size, number of items in a case.
- d. Movement Files
 - These are category-specific files which contain sales data for each UPC for every store
 - The granularity is week level. It contains store number, week number, items sold that week, price, gross margin, etc.
- e. Week's decode table
 - It is available in Dominick's Manual and Codebook pdf. It gives the decode description of week number by including week's start date and end date and also contains information about special events. It could help in understanding the sales patterns during special events or particular part of the year.
- f. Dominick Stores
 - It is available in Dominick's Manual and Codebook pdf. It gives the details corresponding to each store number like city, address, zone, zip code and price tier.

1.3 Metadata

1.3.1 Sales Data

| Variable | Description | Type | Length |
|----------|-------------------------|-----------|--------|
| STORE | Store Code | Numeric | 3 |
| DATE | Date of the Observation | Character | 6 |

| | | | |
|-----------|--------------------------|---------|---|
| WEEK | Week Number | Numeric | 6 |
| MEAT | Meat Sales in Dollars | Numeric | 8 |
| BEER | Beer Sales in Dollars | Numeric | 8 |
| GROCERY | Grocery Sales in Dollars | Numeric | 8 |
| DELI | Deli Sales in Dollars | Numeric | 8 |
| DELI_COUP | Deli Coupons Redeemed | Numeric | 8 |
| FROZEN | Frozen Sales in Dollars | Numeric | 8 |
| DAIRY | Dairy Sales in Dollars | Numeric | 8 |

Table 1.3.1: Sales Data

1.3.2 Demographics

| Variable | Description | Type | Length |
|----------|--|-----------|--------|
| MMID | Mobile Money Identification Number | Numeric | 8 |
| NAME | Name of Store | Character | 16 |
| CITY | Name of City | Character | 16 |
| ZIP | Zip Code of Area | Character | 8 |
| INCOME | Log of Median Income | Numeric | 8 |
| STORE | Store Number | Numeric | 3 |
| AGE60 | % of population over 60 | Numeric | 8 |
| POVERTY | % of population n with income under \$15,000 | Numeric | 8 |
| AGE9 | % of population under 9 | Numeric | 8 |

Table 1.3.2: Demographics

1.3.3 UPC

| Variable | Description | Type | Length |
|----------|---------------------------|-----------|--------|
| UPC | UPC Number | Numeric | 8 |
| COM_CODE | Dominick's commodity code | Numeric | 8 |
| NITEM | Dominick's item code | Numeric | 8 |
| DESCRIP | Product Name | Character | 20 |
| SIZE | Product Size | Character | 6 |
| CASE | Number of items in a case | Numeric | 8 |

Table 1.3.3: UPC

1.3.4 Movement

| Variable | Description | Type | Length |
|----------|----------------------------------|---------|--------|
| UPC | UPC Number | Numeric | 8 |
| STORE | Store Number | Numeric | 3 |
| WEEK | Week Number | Numeric | 3 |
| MOVE | Number of Units Sold | Numeric | 8 |
| PRICE | Retail Price | Numeric | 8 |
| QTY | Number of items bundled together | Numeric | 3 |
| PROFIT | Gross Margin | Numeric | 8 |
| SALE | Sale Code (B, C, S) | Numeric | 8 |
| OK | 1 for valid data, 0 for trash | Numeric | 3 |

Table 1.3.7: Week Decode

1.4 Domain Understanding

- a) **Hamister, J. W., & Suresh, N. C. (2008). The impact of pricing policy on sales variability in a supermarket retail context. International Journal of Production Economics, 111(2), 441-455.** doi:10.1016/j.ijpe.2007.01.011

This paper focuses on how the pricing policy impacts the sales in retail. This study states that using constant price and not dynamic would reduce profit and increase demand volatility. This research uses the data from Dominick to test the hypothesis.

Two important hypothesis that are tested and supported in this study are:

- Demand variability is lower with dynamic pricing
- Profitability is higher with dynamic pricing than it is with static

Learning

We will use this study to check and understand how the sales and profit margin of each cheese category has been affected as per their price during the period 1991-1995. These supported hypotheses indicate that dynamic pricing should be followed by retailers to increase profit and reduce demand variability. Under situation of serial correlation, constant pricing may reduce the profit which will be a significant reduction for retailers in highly competitive market. We will incorporate this finding while analyzing cheese sales vs price fluctuation across cheese products.

- b) **Kamakura, Wagner A., and Wooseong Kang. "Chain-Wide and store-Level analysis for cross-Category management." Journal of Retailing, vol. 83, no. 2, 2007, pp. 159–170., doi:10.1016/j.jretai.2006.02.006.**

This paper helps the retail managers to make decisions which are chain-wide and store-specific. It discusses the impact of price promotions of specific products across the organization. The paper analyzes the effect of discounts at chain level across global organization. It discusses how the price discounts have store-level and cross-category impacts.

Learning

We will use the parameters mentioned in this case study to check for profit fluctuation in cheese. We will see if a low priced cheese product sells in high volume or a higher one. Hence we will be able to understand optimal level of pricing for maximizing profit. This study analyzes Dominick data using the sales and prices of nine brands of toothpaste and 8 brands of toothbrush in 66 stores to investigate store-level and cross- category promotion. These two categories are chosen because of their close connection in consumption. The results indicate that price promotions in toothpaste can have positive and negative effects on various toothpaste brands. This study helps in realizing the effects price promotion has on the sale of brands across stores and categories.

- c) **Nevo, Aviv, and Catherine Wolfram.** “Why Do Manufacturers Issue Coupons? An Empirical Analysis of Breakfast Cereals.” *The RAND Journal of Economics*, vol. 33, no. 2, 2002, p. 319., doi:10.2307/3087436.

This paper analyzes the impact of coupons on sales. Manufacturers issue coupons to lure the low-valuation customers who tend to postpone their purchases. New buyers are attracted by issuing coupons and are tested if they would repurchase the product at full price. The cheapest way for sellers to increase sales, for example at the end of company fiscal year to reach the target, is to provide discounts to everyone but higher price promotions by providing coupons to a few. This increases the sales without much decrease in the profit ratio.

Learning

We will check for the high sales periods for Beer, Grocery, Bakery and video. This will help us figure out when the sales of each of these categories is the highest. This will then be correlated with the pricing of these products during those periods. For Dominick data, on comparing the sales of products during promotional and non-promotional weeks it was found that coupons have different impacts on sale for different products. Offers during some holiday like President's Day and Labor Day did not have much impact on the sales as compared to other special events.

2 Business Questions

2.1 Business Questions List

The business questions listed in order of priority:

- a) How are the store sales affected by the poverty level in the regions?
- b) How are the sales of Bakery products affected during Christmas period over the period 1989 -1996?
- c) Are there any periods during the years 1989-1995 where the video sales are higher or lower?
- d) How are jewelry sales affected by the store price tier?
- e) From year 1991 to 1995, which cigarette brand has the highest profit?
- f) Based on different zones, how much is consumption of non-vegan products like fish, meat and dairy across Chicago?
- g) What is the profit trend of cheese during 1991 to 1995?
- h) How the trend of grocery sales varies across different stores in Chicago?
- i) What are the top cookies that have highest profit in all stores combined?
- j) Detect trends in Beer Sales encompassing the entire duration that look for high period of sales. Detect peaks not only during designated holidays but also on events that are not in the Week_Decode table.

2.2 Business Questions Substantiation and Explanation

Q1. How are the store sales affected by the poverty level in the regions?

Data Processing

- All Sales in Ccount table were summed up for a store to get the total sales
- Poverty percentage from Demographics table is matched to Ccount table using the STORE attribute
- Data grouped by percentage intervals(each interval of 3%) for better visualization

Resulting Pivot

| Poverty | Sum of Sales |
|--------------------|-------------------------|
| 0.03-0.06 | \$7,066,977,014 |
| 0-0.03 | \$6,260,286,283 |
| 0.06-0.09 | \$3,867,227,647 |
| 0.15-0.18 | \$1,723,796,450 |
| 0.09-0.12 | \$698,426,296 |
| 0.12-0.15 | \$422,924,831 |
| 0.21-0.24 | \$169,266,615 |
| 0.18-0.21 | \$163,159,911 |
| Grand Total | \$20,372,065,047 |

Figure 2.2-1: Pivot Table

Resulting Graph

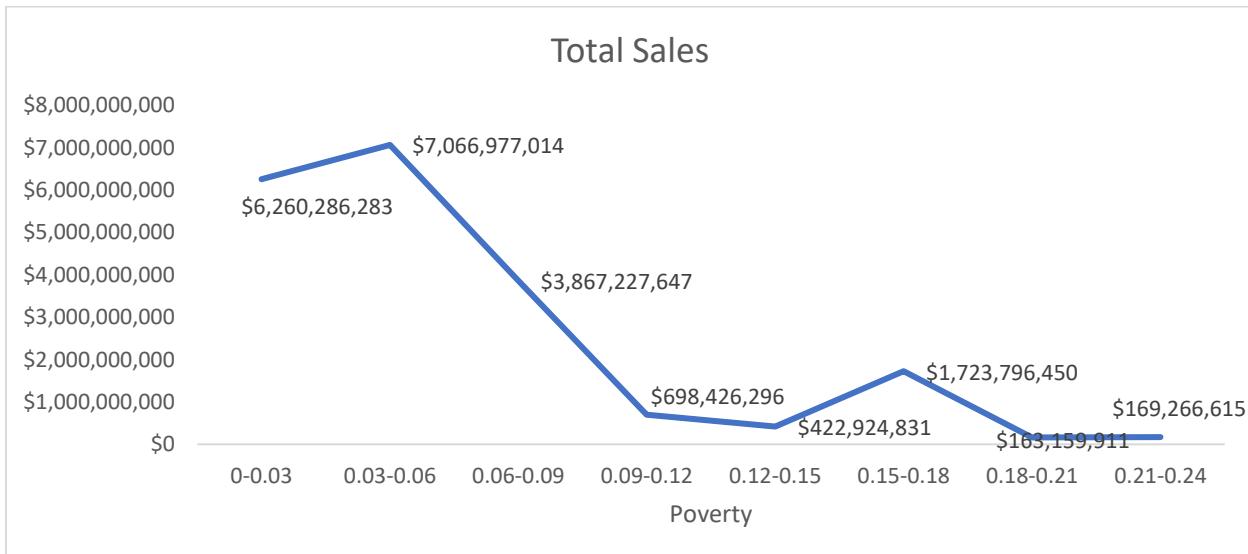

Figure 2.2-2: Pivot Chart

ERD

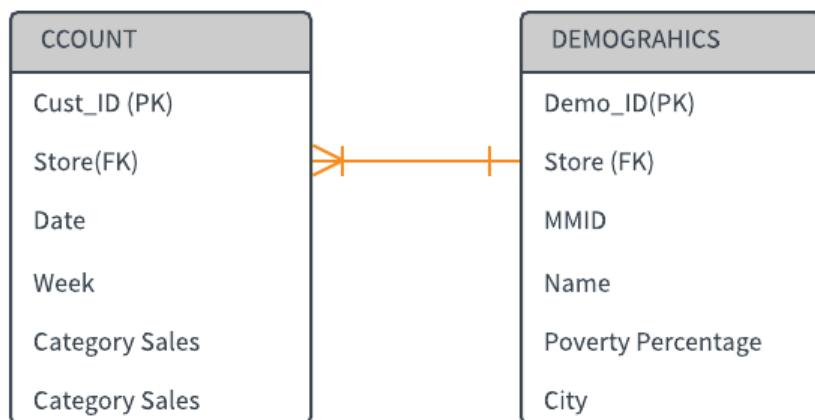

Figure 2.2-3: ERD

Justification

This data can be used to understand how opening a store in a poverty stricken area will impact the business revenue growth. Discovering this trend through current data will make it possible to estimate increase in topline of the business when a store is opened in a new area. Business heads can align opening of new stores as per their commercial targets. For example, if the new store needs to generate high revenue it must be opened in a region with low poverty percentage. Hence an area can be mapped to desired levels of sales estimations. Another application of this pattern is to check if all stores meet a minimum level of sales generation in order to meet the operational cost required to make them profitable. Any stores below this minimum levels must be closed.

Q2. How are the sales of Bakery products affected during Christmas period over the period 1989 -1996?

Data Processing

- Christmas week for each of the year('89-'96) was identified from the Week_Decode table
- The week was then mapped to the bakery product in the CCOUNT table
- Sales variance is then calculated for each of the day of the Christmas week

Resulting Pivot

| Bakery Sales | | |
|--------------|--------|-----------|
| WEEK | DATE | Total |
| 15 | 891221 | \$139,171 |
| | 891222 | \$198,816 |
| | 891223 | \$289,826 |
| | 891224 | \$224,360 |
| | 891225 | \$0 |
| | 891226 | \$79,063 |
| 67 | 891227 | \$85,595 |
| | 901220 | \$162,995 |
| | 901221 | \$184,009 |
| | 901222 | \$231,678 |
| | 901223 | \$227,401 |
| | 901224 | \$280,865 |
| 119 | 901225 | \$18,382 |
| | 901226 | \$85,078 |
| | 911219 | \$155,673 |
| | 911220 | \$154,954 |
| | 911221 | \$221,315 |
| | 911222 | \$174,649 |
| 119 | 911223 | \$236,052 |
| | 911224 | \$297,513 |
| | 911225 | \$24,511 |

Figure 2.2-4 Pivot Table

Resulting Graph

Figure 2.2-5: Pivot Chart

ERD

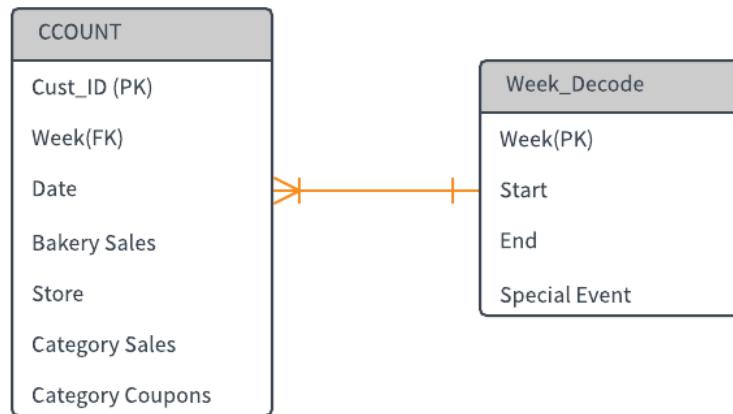

Figure 2.2-6: ERD

Justification

It is critical for the Retail chain to exactly know the period when demand relating to Christmas activities is at its peak. Christmas is the time when consumers are on a spending spree. For example, there is no point in procuring more inventory after Peak Sales Period has passed. This question answers what “Peak Sales Period” is. It will allow store managers to predict when they will experience peak demand. They can hence prepare their inventories to meet this demand. Replenishing inventory always involves a certain amount of lead time after an order has been placed to when it is delivered to store. Hence store manager can stock up their inventories using the pattern discovered in this question. For example – as per the graph, peak sales for bakery products happened two days before Christmas. No sales for Bakery took on Christmas day. Correspondingly, store managers need to place purchase orders to meet demand experienced two days before Christmas and no orders are needed for the Christmas day itself. This pattern if repeats every year forms a strong basis for ordering. Our question will answer this aspect. It is to notice that a short period of time before Christmas is only being considered as we are analyzing the sales of bakery products which are *perishable*. If the analysis is done for a *non-perishable* product the time period can range from 2-3 weeks prior to Christmas.

Q3. Are there any periods during the years 1989-1995 where the video sales are higher or lower?

Data Processing

- Video Sales are mapped against their weekly volumes in the Ccount table
- This data will be aggregated on monthly basis to check the trend.

Resulting Pivot

| Week | Video Sales |
|------|-------------|
| 1 | 102006.92 |
| 2 | 89368.81 |
| 3 | 284169.44 |
| 4 | 130738.06 |
| 5 | 221438.18 |
| 6 | 119813.59 |
| 7 | 93769.21 |
| 8 | 114456.83 |
| 9 | 209826.94 |
| 10 | 563262.31 |
| 11 | 314194.01 |
| 12 | 315516.72 |
| 13 | 108314.95 |
| 14 | 130643.33 |
| 15 | 151202.66 |

Figure 2.2-7: Pivot Table

Resulting Graph

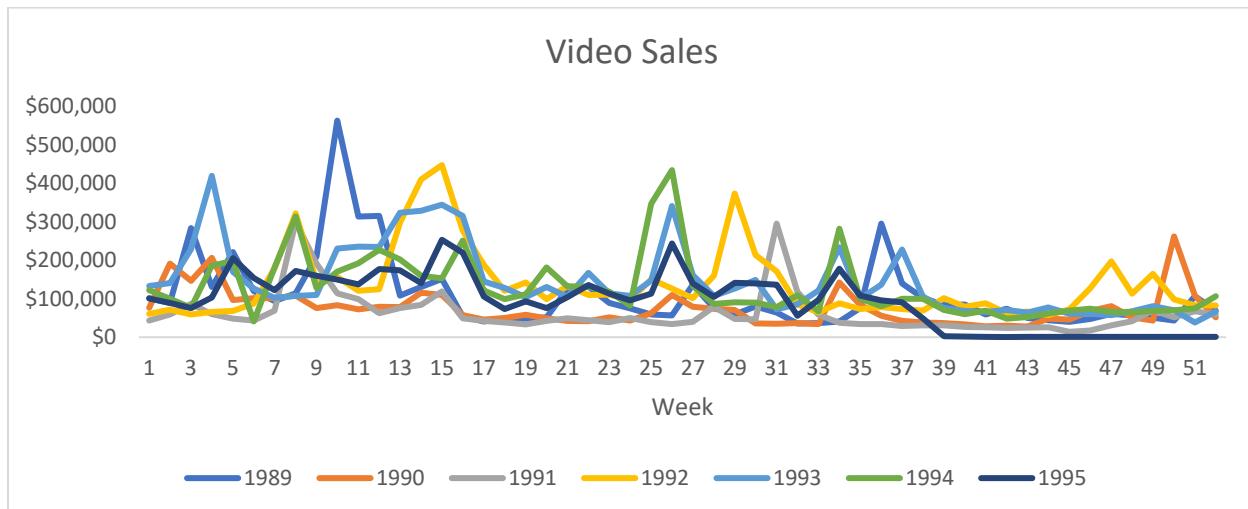

Figure 2.2-8: Pivot Chart

ERD

Figure 2.2-9: ERD

Justification

During the period 1989 to 1995 videos were a novel technology. Video watching was not a regular day to day activity as it is today. This question analyzes when these videos were being watched. The question aims to discover if there is any pattern in the way users were consuming videos in this era. This insight is useful to stock videos in a store during high demand period. In the low demand period the shelf space used for videos can be reduced and be released for day to day items such as groceries, cookies, chocolates etc. Hence this question will help in store shelf management by only stocking videos only during the time of demand. Our preliminary analysis depicts period peaks and troughs. This will be further explored in the project.

Q4. How are jewelry sales affected by the store price tier?

Data Processing

- Store Price tier is selected from Store Table
- Price Tier is mapped to store in Ccount file

Resulting Pivot

| Price Tier | Sum of JEWELRY |
|--------------------|--------------------|
| Medium | \$1,384,166 |
| Low | \$682,406 |
| High | \$642,934 |
| CubFighter | \$302,270 |
| Grand Total | \$3,011,777 |

Figure 2.2-10: Pivot Table

Resulting Chart

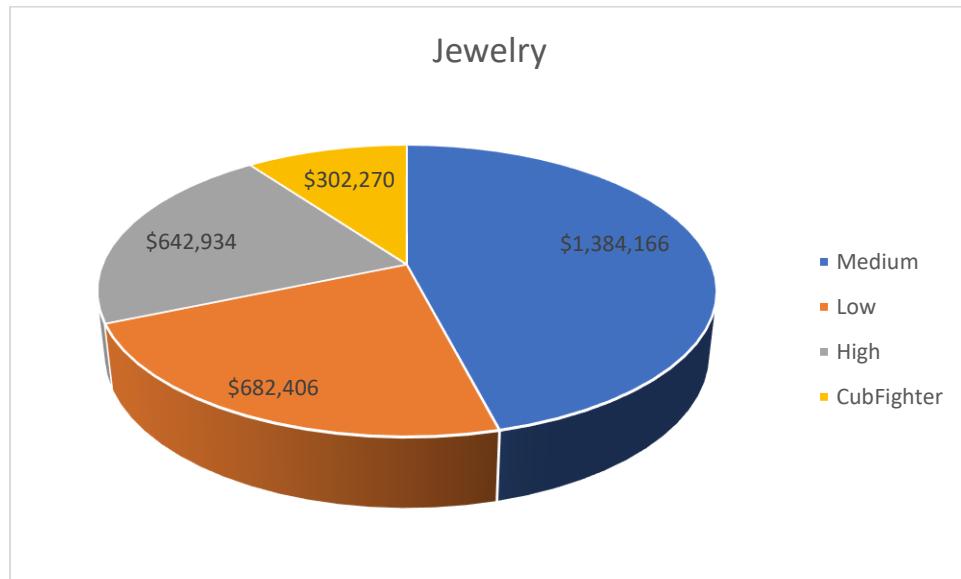

Figure 2.2-11: Pivot Chart

ERD

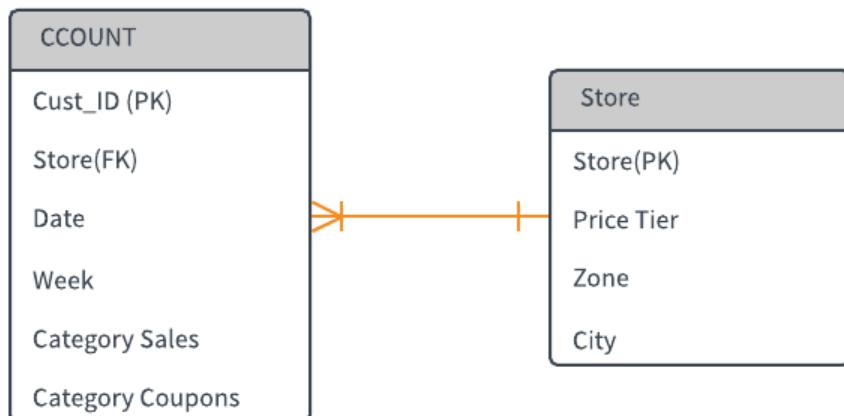

Figure 2.2-12: ERD

Justification

A close study is required for a luxury item such as jewelry because usually it is not the core competency of a retail store. One would intuitively believe that jewelry sales for the retail store would be the most in its highest price tier. But our preliminary analysis suggests that the medium price tier stores are selling more jewelry than the high price tier stores. This question would look at data and analyze which stores should DFF focus on for its jewelry business.

Q5.From year 1991 to 1995, which cigarette brand has the highest profit?

Data Processing

- Profit for each item in the movement file for cigarette was calculated using the formulae $((move * price / qty) * profit / 100)$
- A pivot was then calculated to determine what are the most profitable items
- The names of these items were taken from UPC cigarette file through vlookup

Resulting Pivot

| UPC | Sum of Final Profit | DESCRIP |
|------------|---------------------|----------------------|
| 197 | \$16,648,945 | CIGARETTES SINGLE PA |
| 1230000024 | \$389,207 | CIGARETTES (SINGLE P |
| 1230000010 | \$370,702 | CIGARETTES (SINGLE P |
| 1230000011 | \$305,693 | CIGARETTES (SINGLE P |
| 1230000025 | \$237,548 | CIGARETTES (SINGLE P |
| 1230000020 | \$235,239 | CIGARETTES (SINGLE P |
| 194 | \$217,040 | GENERIC SINGLE |
| 1230000013 | \$213,203 | CIGARETTES (SINGLE P |
| 1230000026 | \$210,678 | CIGARETTES (SINGLE P |
| 1230000014 | \$178,920 | CIGARETTES (SINGLE P |
| 1230000022 | \$161,957 | CIGARETTES (SINGLE P |
| 1230000012 | \$108,789 | CIGARETTES (SINGLE P |
| 1230000017 | \$89,858 | CIGARETTES (SINGLE P |
| 1230000018 | \$83,485 | CIGARETTES (SINGLE P |
| 1100015308 | \$76,399 | KING CARTON |
| 1230000007 | \$68,047 | CIGARETTES SINGLE PA |
| 1230000004 | \$64,659 | CIGARETTES SINGLE PA |
| 1230000001 | \$63,779 | CIGARETTES SINGLE PA |
| 193 | \$53,396 | 25 CT SINGLE PACK CI |
| 1230000019 | \$48,472 | CIGARETTES SINGLE PA |

Figure 2.2-13: Pivot Table

Resulting Graph

This is a ranking exercise to select Top brands which will be visualized only through a pivot table. Hence no graph has been prepared

ERD

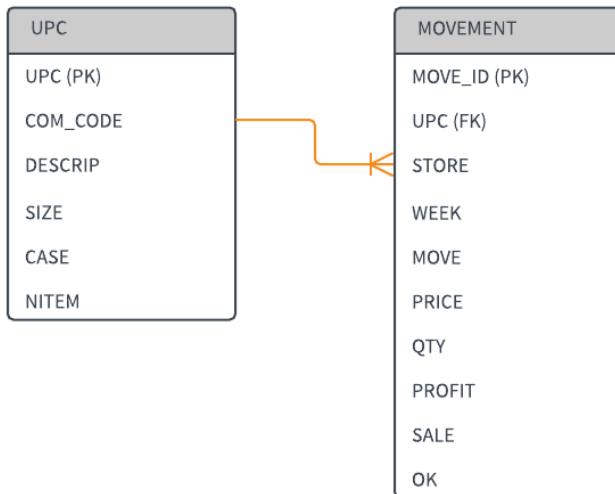

Figure 2.2-14: ERD

Justification

By analyzing profits of cigarettes over the five year period from 1991 to 1995, we can understand the trend in cigarettes sales. Moreover, we will be able to recognize the brand of cigarette which has more margin than the other brands. This information will help a retailer to stock up the brand which has higher margin to cater the customer needs. The question can also find out which are low performing brands and will help in weeding out brands not meeting the minimum profit criteria. Such brands will be taken off from shelves. This information will assist in both shelf as well as inventory management.

Q6. Based on different zones, how much is consumption of non-vegan products like fish, meat and dairy across Chicago?

Data Processing

- City and Zone for a store we looked up from the Demographics table
- Sales dollars for Dairy, Fish and Meat were taken from Ccount table

Resulting Pivot

| City | CHICAGO | ▼ | | |
|--------------------|---------------------|----------------------|----------------------|--------------|
| Zone | ▼ | Sum of FISH | Sum of MEAT | Sum of DAIRY |
| 1 | \$13,156,490 | \$88,448,796 | \$69,324,088 | |
| 2 | \$8,874,569 | \$68,920,087 | \$57,837,695 | |
| 5 | \$2,995,019 | \$26,070,552 | \$20,411,042 | |
| 7 | \$8,714,674 | \$51,263,163 | \$55,261,456 | |
| 10 | \$1,417,653 | \$13,878,544 | \$9,521,848 | |
| 11 | \$7,228,776 | \$47,029,714 | \$39,654,619 | |
| 12 | \$2,041,704 | \$23,095,245 | \$19,594,750 | |
| Grand Total | \$44,428,884 | \$318,706,101 | \$271,605,497 | |

Figure 2.2-15: Pivot Table

Resulting Graph

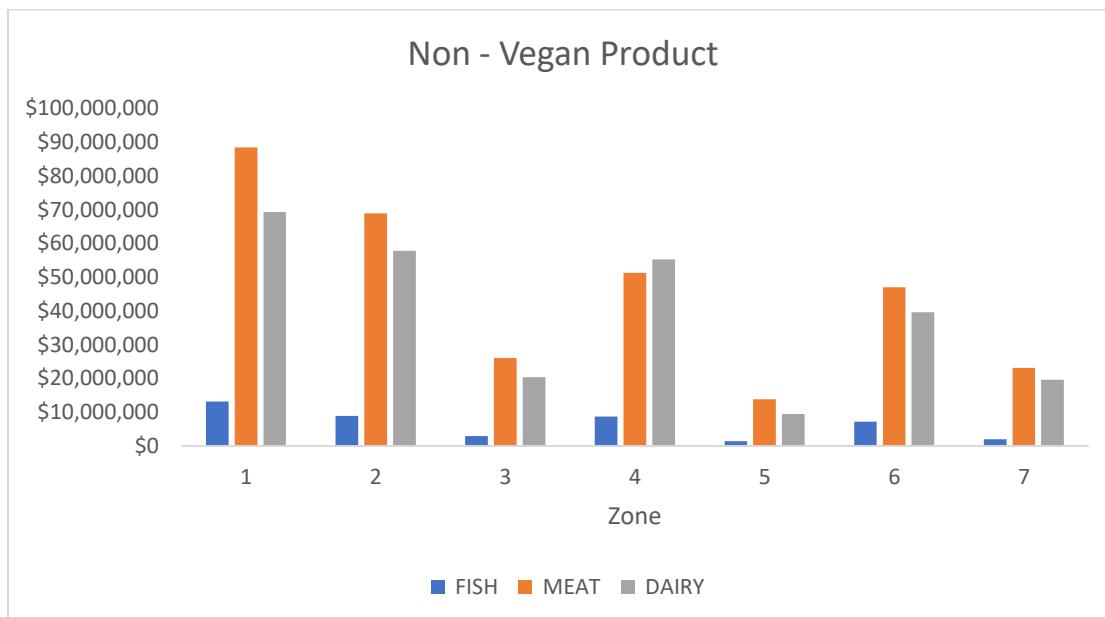

Figure 2.2-16: Pivot Chart

ERD

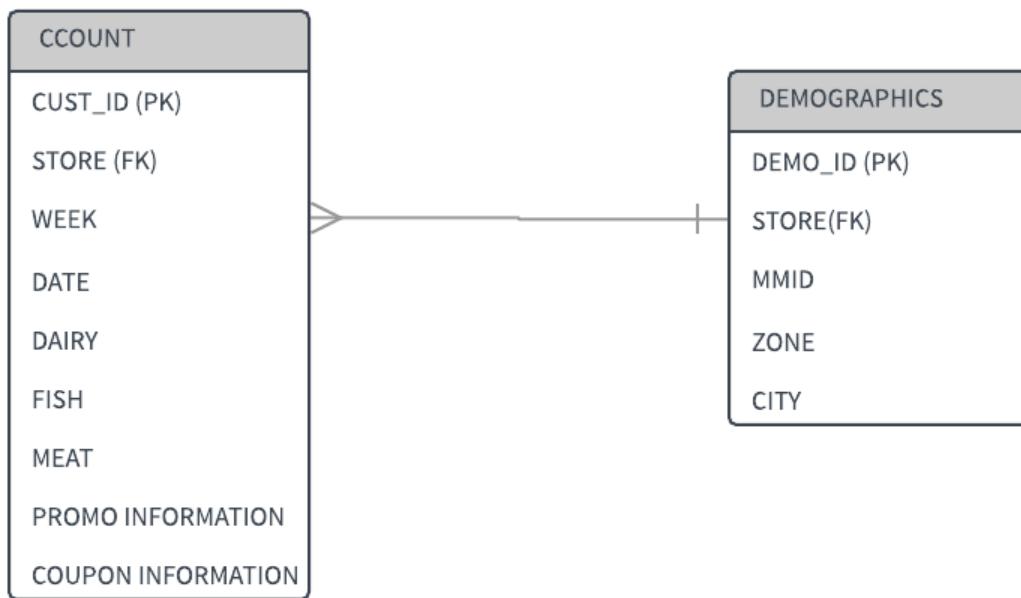

Figure 2.2-17: ERD

Justification

Going vegan has been a prevailing food trend. A vegan is a person who abstains from consuming animal products. Studying the sales of non-vegan products like fish, meat and dairy can help estimate the customer base of vegetarians and vegans in the zone. This will help DFF to manage the stock of vegan foods as per the sale trends. The store in the zone which has higher sale of non-vegan foods should stock up more fish, meat and dairy, whereas, the store in the zone with higher vegan food consumption should reduce the stock of fish, meat and dairy, in addition increase the stock of vegetables and other vegan food.

Q7. What is the profit trend of cheese during 1991 to 1995?

Data Processing

- Cheese profit for each UPC in Movement file is calculated using the formulae $((move * price / qty) * profit / 100)$
- Data will be aggregated on annual basis

Resulting Pivot

| Week Num | Sum of Final Profit |
|----------|---------------------|
| 1 | 21163.71379 |
| 2 | 20959.02892 |
| 3 | 22631.23713 |
| 4 | 23267.28938 |
| 5 | 24747.56578 |
| 6 | 24273.32336 |
| 7 | 25643.08066 |
| 8 | 26948.80003 |
| 9 | 24777.82375 |
| 10 | 29169.12299 |
| 11 | 20552.58679 |
| 12 | 26643.48755 |
| 13 | 53990.0209 |
| 14 | 29692.48695 |
| 15 | 25836.26845 |
| 16 | 21661.88723 |
| 17 | 20997.37402 |
| 18 | 21623.2445 |
| 19 | 24095.24999 |
| 20 | 29065.50602 |

Figure 2.2-18: Pivot Chart

Resulting Graph

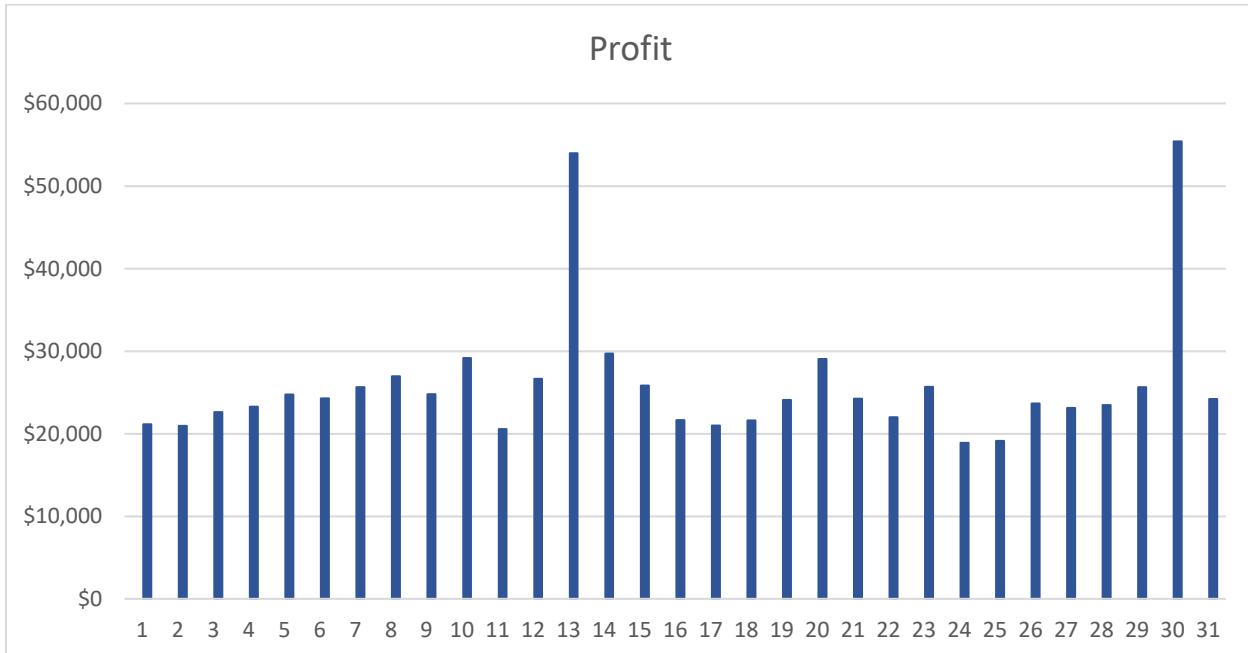

Figure 2.2-19: Pivot Chart

ERD

Figure 2.2-20: ERD

Justification

By analyzing profits of cheese over the five-year period from 1991 to 1995, we can understand the trend in cheese sales across years. This also will help retailers understand which cheese products generate high profit from their sale so that the production of those cheese products can be increased. It also helps in finding out the cheese products with low profit from cheese sale so that they can shift their focus from cheese sale because perhaps the demand of cheese is not high in that area or high profit margin cheese are not popular there. This information will assist in both shelf as well as inventory management.

Q8. How the trend of grocery sales varies across different stores in Chicago?

Data Processing:

- City for a store is looked up from Store table
- Grocery Sales for stores are picked up from Ccount table

Resulting Pivot

| City | Chicago |
|--------------------|------------------------|
| Store | GROCERY SALES |
| 12 | \$74,943,358 |
| 25 | \$11,479,544 |
| 33 | \$57,030,266 |
| 53 | \$58,973,692 |
| 68 | \$53,274,821 |
| 73 | \$101,435,589 |
| 75 | \$54,922,153 |
| 76 | \$65,495,733 |
| 86 | \$77,421,637 |
| 89 | \$51,988,043 |
| 90 | \$53,394,946 |
| 95 | \$61,128,336 |
| 98 | \$93,185,926 |
| 100 | \$87,738,612 |
| 111 | \$62,092,452 |
| 113 | \$83,278,312 |
| 123 | \$67,852,188 |
| 128 | \$86,124,054 |
| 130 | \$55,661,537 |
| Grand Total | \$1,257,421,198 |

Figure 2.2-21: Pivot Chart

Resulting Graph

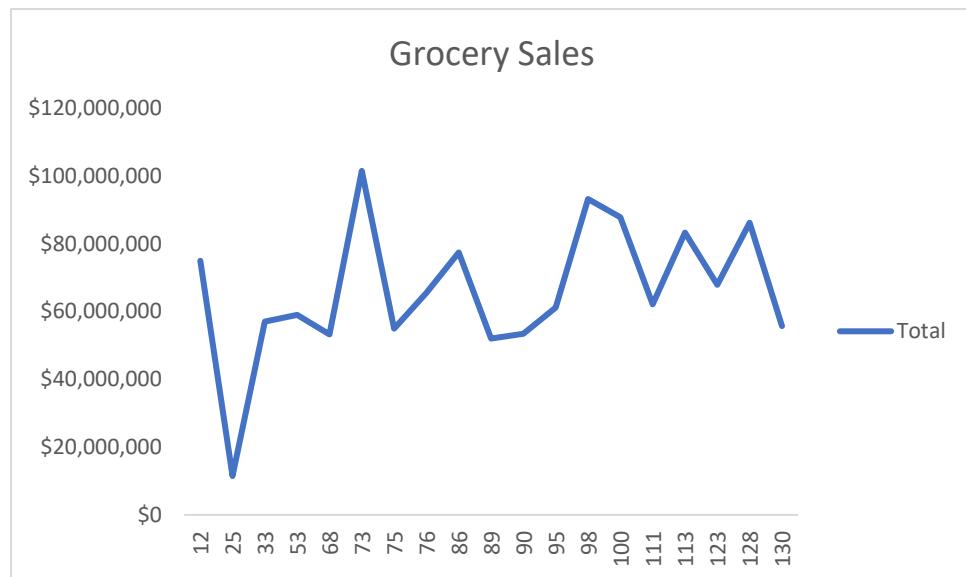

Figure 2.2-22: Pivot Chart

ERD

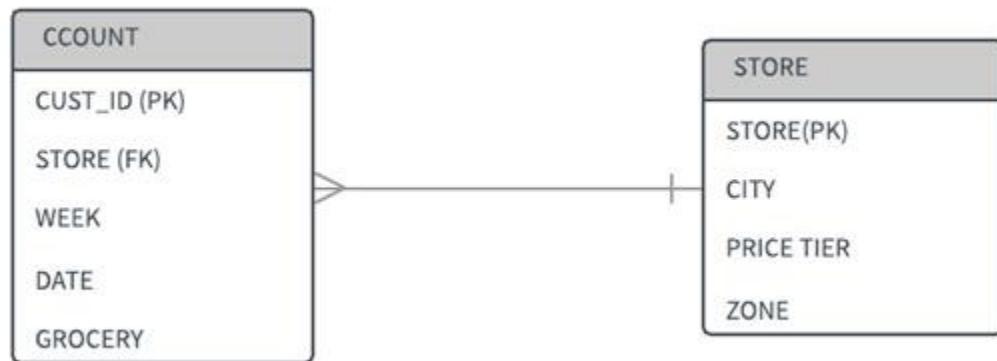

Figure 2.2-23: ERD

Justification

Grocery are brought routinely by everyone and is provided in the each store. Studying the sales of grocery across different stores in a city will help DFF in stock management. Moreover, this analysis will help identifying the stores where the grocery sales are higher and lower. Store with higher sales of grocery should stock up more groceries, whereas, for stores with lower sale, strategies can be planned to enhance sales or these stores can be shut if the losses are high.

Q9. What are the top cookies that have highest profit in all stores combined?

Data Processing

- Profit is calculated for each cookie as per the profit formulae((move*price/qty)*profit/100)
- UPCs with top profits are selected from the movement file using a pivot
- Cookie names are then looked up from UPC table

Resulting Pivot

| Cookie Name | Sum of Profit |
|-----------------------|---------------|
| PPF PARTY FAVORITES | \$90,782 |
| P FARM DOUBLE CHOC M | \$78,520 |
| PPF DESSERT FAVORITE | \$48,138 |
| P FARM TAHOE AMER CO | \$25,806 |
| \$PEPP FARM CAFE' FAV | \$25,591 |
| PEP FARM OATMEAL RAI | \$25,445 |
| PEP FRM CHERRY COBBL | \$11,527 |
| ~PF | \$5,121 |

Figure 2.2-24: Pivot Table

Resulting Graph

This is a ranking exercise to select Top brands which will be visualized only through a pivot table. Hence no graph has been prepared

ERD

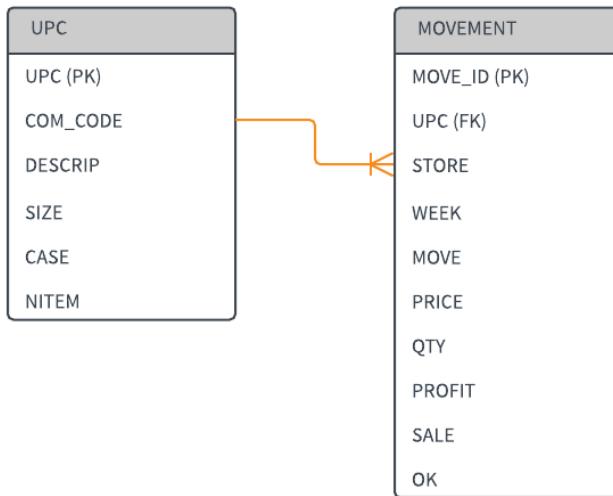

Figure 2.2-25: ERD

Justification

This analysis helps in identifying the top cookies with highest profit in all the stores combined which can help understand the trend in cookies sale. The top profitable brands should be focused on more and their stocks should be increased to gain high profits and meet customer needs. This analysis can also find out which are low profit brands and will help in taking the brands off the shelf which are not meeting the minimum profit criteria. This will help in better inventory management and hence improve the overall profits.

Q10. Detect trends in Beer Sales encompassing the entire duration that look for high period of sales. Detect peaks not only during designated holidays but also on events that are not in the Week_Decode table.

Data Processing

- Beer Sales are mapped against their weekly volumes in the Ccount table

Resulting Pivot

| Week | Sum of BEER |
|------|-------------|
| 1 | \$323,262 |
| 2 | \$310,749 |
| 3 | \$334,978 |
| 4 | \$310,008 |
| 5 | \$319,366 |
| 6 | \$326,395 |
| 7 | \$361,653 |
| 8 | \$329,395 |
| 9 | \$317,514 |
| 10 | \$543,976 |
| 11 | \$339,089 |
| 12 | \$312,602 |
| 13 | \$355,500 |
| 14 | \$475,092 |
| 15 | \$586,086 |
| 16 | \$507,795 |
| 17 | \$286,805 |
| 18 | \$280,094 |
| 19 | \$294,689 |
| 20 | \$406,287 |

Figure 2.2-26: Pivot Table

Resulting Graph

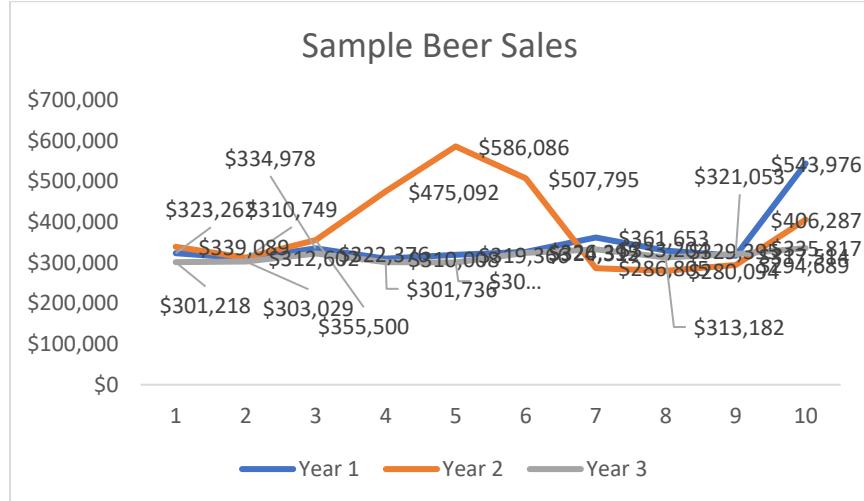

Figure 2.2-27: Pivot Chart

ERD

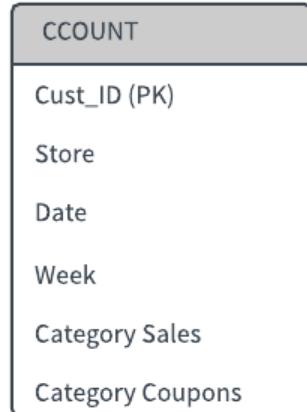

Figure 2.2-28: ERD

Justification

Most of us consider beer as a staple. Be it a college graduate, a working professional or a retired person, almost everybody consumes it. Also, beer is best served cold, it has to be refrigerated before it is to be. Also, since beer is a non-perishable product, it can be stocked up. By studying the sale of beer across multiple DFF stores, stores with higher and lower beer sales can be identified. This analysis will prove to be a valuable insight as it can help DLL in stock management and inventory management. Moreover, this will help management take decisions for the beer pricing. Management can use strategies like, stores with higher sales of beer and lower prices can use an idea to reduce the prices by little to increase beer sales and profit.

2.3 Final Selected Business Questions

The business question finally selected are as below -

Q1. How are the sales of Bakery products affected during Christmas period over the period 1989-1996?

Q2. Are there any periods during the years 1989-1995 where the video sales are higher or lower?

Q3. What is the profit trend of cheese during 1991 to 1995?

Q4. How the trend of grocery sales varies across different stores in Chicago?

Q5. Detect trends in Beer Sales encompassing the entire duration that look for high period of sales. Detect peaks not only during designated holidays but also on events that are not in the Week_Decode table.

3 Independent Data Marts Design using Kimball's approach

3.1 Build Matrix

3.1.1 List Data Marts

We have created two data marts to model data required to fulfill business questions requirements. These data marts have been carefully crafted to ensure accurate and relevant information is stored and retrieved to support business questions. The two data marts are as below-

1. Fact Category Sales Data Mart
2. Fact Product Margin Data Mart

3.1.2 List Dimensions

We have used four dimensions to analyze the data. These are –

1. Category Dimension
2. Time Dimension
3. Store Dimension
4. Product Dimension

3.1.3 Mark the Intersection

The matrix indicates how dimension tables will be used in combination with fact tables to create required data marts. A * in row-column indicates the presence of dimension-fact table combination in the matrix.

| | Dimension Table | | | |
|---------------------|-----------------|------|-------|---------|
| Fact table | Category | Time | Store | Product |
| Fact Category Sales | * | * | * | |
| Fact Product Margin | | * | | * |

Table 3.1.1: Dimension Matrix

3.2 Design Each Fact Tables

3.2.1 Choose Data Mart

Data Mart 1 – Category Sales Data Mart

It will cater to business questions across Category, Time and Store dimensions with measures on each category. It will provide insights on questions 1 to 3 and 5.

Data Mart 2 – Product Margin Data Mart

It will cater to business questions across Time and Product dimensions with measures on each Product. It will provide insights on questions 4.

3.2.2 Declare Grain

Data Mart 1 – Category Sales Data Mart

Sales Data will be aggregated along Category, Time and Store Dimension. Time will aggregate data, at the lowest level, on weekly basis for each store and each category. Hence, the lowest level of detail i.e. data granularity of this data mart is at week level for each store and category.

Data Mart 2 – Product Margin Data Mart

Sales Data will be aggregated along Product and Time Dimension. Time dimension will aggregate data, at the lowest level, on weekly basis for each product. Hence, the lowest level of detail i.e. data granularity of this data mart is at week level for each product.

3.2.3 Choose Dimensions

The dimensions that will be used for Data Mart 1 – Category Sales Data Mart

1. Store
2. Category
3. Time

The dimensions that will be used for Data Mart 2 – Product Margin Data Mart

1. Product
2. Time

3.2.4 Include Derived Fact

Derived fact is included only in Data Mart 2 – Product Margin Data Mart. The profit margin for each record is calculated using the formulae $((\text{move} * \text{price}) / \text{qty}) * \text{profit} / 100$.

3.2.5 Design Fact Table

3.2.5.1 Fact Category Sales

Figure 3.2-1: Fact Category Sales

Fact Table Attribute Description:

- **Category_ID** - This is a surrogate key which identifies the category of the product.
- **Store_ID** - Primary key which uniquely identifies each retail store of Dominick's Finer Foods (DFF). This is a surrogate key.
- **Time_ID** - This is a surrogate key uniquely identifies time of purchase.
- **Category_Amount** – Total sales amount for that category.

3.2.5.2 Fact Product Margin

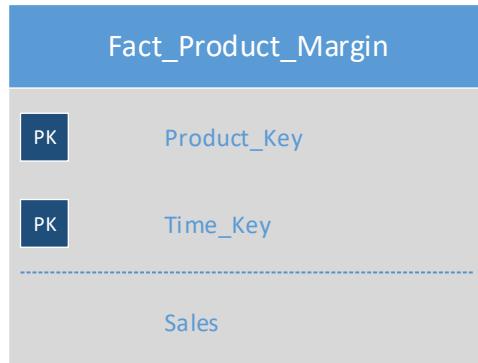

Figure 3.2-2: Fact Product Margin

Fact Table Attribute Description:

- **Product_ID** - Primary key which uniquely identifies each product in Dominick's Finer Foods (DFF) retail stores. This is a surrogate key.
- **Time_ID** - This is a surrogate key uniquely identifies time of purchase.
- **Product_Sales** – Identifies the total dollar sales.

3.3 Design Dimension Table

3.3.1.1 *dimProduct*

Dimensions with information on Product Names and UPC Numbers.

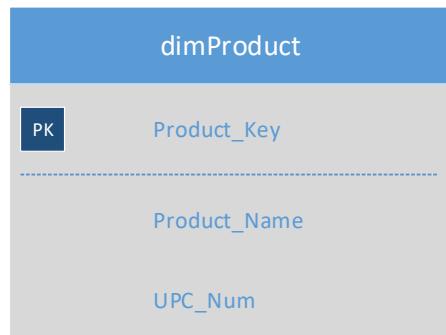

Figure 3.3-1: dimProduct Dimension

Dimension Table Attribute Description:

- **Product_ID** - Primary key for Product dimension table which uniquely identifies each product in Dominick's Finer Foods (DFF) retail stores. This is a surrogate key.
- **Product_Name** - Product name for each item.
- **UPC_Num** - Last five digit of the UPC number identify the product, the remaining digits identify the manufacturer.

3.3.1.2 *dimStore*

Dimensions with information on Store Number with corresponding city and price tiers.

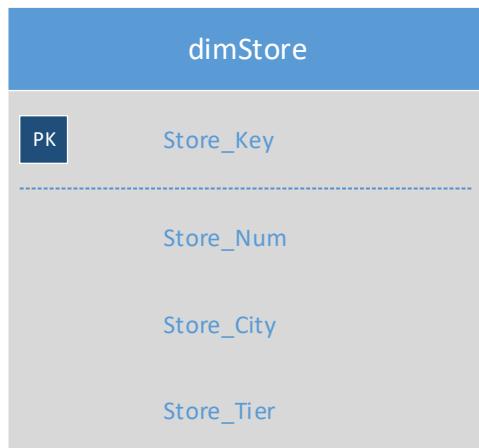

Figure 3.3-2: dimStore Dimension

Dimension Table Attribute Description:

- **Store_ID** - Primary key for Store dimension table which uniquely identifies each retail store of Dominick's Finer Foods (DFF). This is a surrogate key.
- **Store_Num** - Number assigned to each of DFF's stores.
- **Store_City** – City where the DFF store is located.

- **Store_Tier** – Price tier in which the store falls.

3.3.1.3 dimCategory

Dimension with category name information.

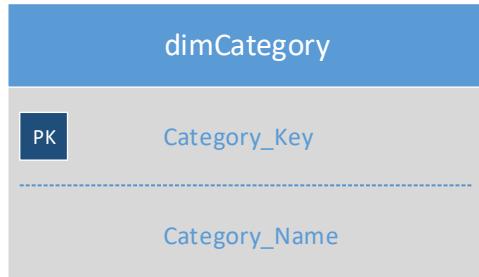

Figure 3.3-3: dimCategory Dimension

Dimension Table Attribute Description:

- **Category_ID** - This is a surrogate key which identifies the category of the product.
- **Category_Name** – Name of the category under which the product falls.

3.3.1.4 dimTime

Dimension with Time information on Year, Month and Week Number along with special events.

Figure 3.3-4: dimTime Dimension

Dimension Table Attribute Description:

- **Time_ID** - Surrogate key for time dimension table.
- **Year** - Identifier for the year to record the sales of products in DFF's stores
- **Month** - Identifier for the month to record the sales of products in DFF's stores.
- **Week_Num** - Identifier for the week number to record the sales of products in DFF's stores.

- **Week_Event** - Identifier for the special event during the week.

3.4 Design Star Schema for Each Data Mart

The selected dimension tables and fact tables along with dimensional matrix have been used to create and design following two data marts in STAR schema:

- Category Sales Data Mart
- Product Margin Data Mart

3.4.1.1 Fact Category Sales Data Mart

The Category Sales Data Mart encompasses following fact and dimension tables:

Fact table: Category Sales fact table

Dimension tables: Store dimension table, Category dimension table and Time dimension table

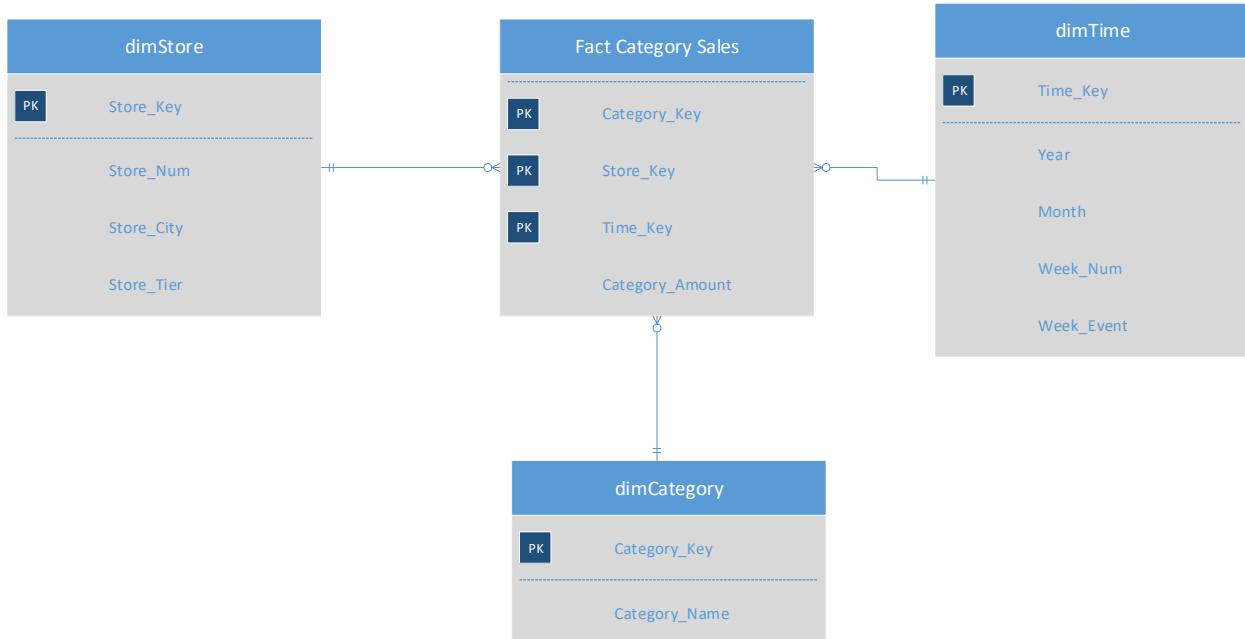

Figure 3.4-1: Fact Category Sales Data Mart

3.4.1.2 Fact Product Margin Data Mart

The Product Margin data mart encompasses following fact and dimension tables:

Fact table: Product Margin fact table

Dimension tables: Product dimension table and Time dimension table

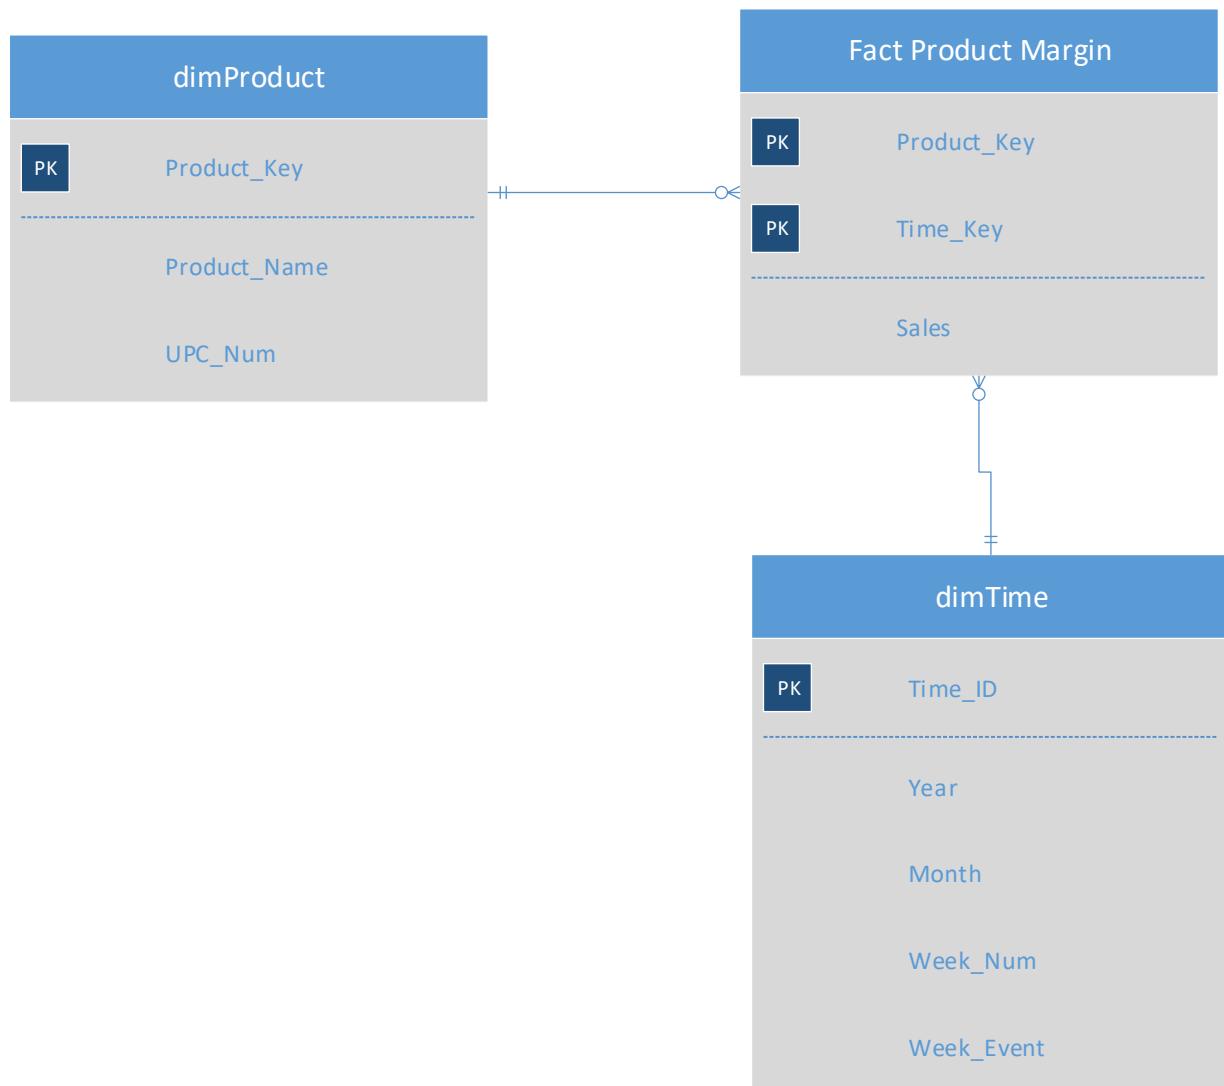

Figure 3.4-2: Fact Product Margin Data Mart

3.5 Mapping Tables

3.5.1.1 Category Sales Data Mart

| DW Dimension Table | Source Table | Source Table Attribute | DW Dimension Table Attribute | Mapping Function |
|--------------------|--------------|------------------------|------------------------------|----------------------------|
| dimCategory | | | Category_Key | None |
| | Ccount | | Category_Name | Column Names as Categories |

Table 3.5.1: Category Dimension Table

| DW Fact Table | Source Table | Source Table Attribute | DW Fact Table Attribute | Mapping Function |
|---------------------|--------------------|------------------------|-------------------------|--------------------------|
| Fact Category Sales | Category Dimension | | Category_Key | Primary key |
| | Store Dimension | | Store_Key | Primary key |
| | Time Dimension | | Time_Key | Primary key |
| | Ccount | None | Category_Amount | Sales of each categories |

Table 3.5.2: Category Sales Fact Table

| DW Dimension Table | Source Table | Source Table Attribute | DW Fact Table Attribute | Mapping Function |
|--------------------|--------------|---------------------------|-------------------------|-------------------------------------|
| dimTime | Week Decode | Week # | Week_Num | None |
| | | Start Column - End Column | Year | Determine Year by Start & End Date |
| | | Start Column - End Column | Month | Calculate month by Start & End Date |
| | | Special Events | Week_Event | None |
| | | | | |

Table 3.5.3: Time Dimension Table

3.5.1.2 Product Margin Data Mart

| DW Dimension Table | Source Table | Source Table Attribute | DW Dimension Table Attribute |
|--------------------|--------------|------------------------|------------------------------|
| dimProduct | UPC Table | | Product_Key |
| | | UPC | UPC_Num |
| | | Descrip | Product_Name |

Table 3.5.4: Product Dimension Table

| DW Dimension Table | Source Table | Source Table Attribute | DW Dimension Table Attribute |
|--------------------|-------------------|------------------------|------------------------------|
| dimStore | Dominick's Stores | | Store_Key |
| | | Store | Store_Num |
| | | City | Store_City |
| | | Price Tier | Store_Tier |

Table 3.5.5: Store Dimension

| DW Fact Table | Source Table | Source Table Attribute | DW Fact Table Attribute | Mapping Function |
|--------------------|-------------------|------------------------|-------------------------|----------------------------------|
| Fact Product Sales | Product Dimension | | Product_Key | Primary key |
| | Store Dimension | | Store_Key | Primary key |
| | | | Product_Sales | Product Sales = (Price*Move)/Qty |

Table 3.5.6: Product Margin Fact Table

3.6 Data Design Justification

Q1 How are the sales of Bakery products affected during Christmas period over the period 1989 -1996?

Sales of Bakery product will be analyzed through the Category Sales Data Mart. Total sales amount data in a product category will be stored in the fact table Category Sales. Category will be selected using Category dimension. This data will be sliced and diced using Time dimension to analyze trend in sales of Bakery Product during period 1989 -1996.

Q2 Are there any periods during the years 1989-1995 where the video sales are higher or lower? Sales of Videos will be analyzed through the Category Sales Data Mart. Total sales amount data for videos will be stored in the fact table Category Sales. Video Category will be selected using Category dimension. This data will be sliced and diced using Time dimension to examine trend in sales of videos during period 1989-1995.

Q3 What is the profit trend of cheese during 1991 to 1995?

Profit trend will be analyzed through the Product Margin Data Mart. Total Profit Sales Amount data for cheese will be derived and saved in the Product Margin Data Mart as per the mapping function. Each of the cheese product will be identified and studied using Product dimension. The profit will be sliced and diced using the Time dimension.

Q4 How the trend of grocery sales varies across different stores in Chicago?

Sales of Grocery will be analyzed through the Category Sales Data Mart. Total sales amount data for grocery will be stored in the fact table Category Sales. Grocery Category will be selected using Category dimension. This data will be sliced and diced using Store and Time dimension to examine trend in sales of grocery.

Q5 Detect trends in Beer Sales encompassing the entire duration that look for high period of sales.

Detect peaks not only during designated holidays but also on events that are not in the Week_Decode table.

Sales of Beer will be analyzed through the Category Sales Data Mart. Total sales amount data for beer will be stored in the fact table Category Sales. Beer Category will be selected using Category dimension. This data will be sliced and diced using Time dimension to examine trend in sales of grocery.

4 Data Cleaning and Integration

4.1 Data Quality Issues

The source data used for analysis was polluted. It had various quality issues such as dummy values in fields, absence of data values, unofficial use of fields, violation of business rules, inconsistent and incorrect values etc. The data quality issues specific to the creation of our data mart have been provided in table

| Group | Quality | Issues Considered | Example of Data Quality Problem |
|------------------------|-----------------------|---|--|
| Relation to other data | Referential Integrity | Do records exist where expected? Do they contain unnecessary or inactive data? Are reference files/tables complete? | It was difficult to track referential integrity as there were a lot of null values for attributes which could be considered as primary keys. For example, Store number had repeated and inconsistent values. |
| | Cardinality | Is the structure of relationships among entities and attributes maintained consistently? | There is a high level of inconsistency in the structure of relationships among entities and attributes. |

| | | | |
|----------------------------|-----------------|---|--|
| Structure of fields | Format | Do values follow consistent formatting standards? | In Week_Decode table, prior to the data conversion operation on this file, we were unable to use the dates. The format of date is different in different excel sheets. |
| | Standard | Are data elements consistently defined and understood? | Lack of standardization makes it difficult to understand what values the attributes hold. For example, Coupons had certain decimal values which makes it difficult to guess if it is a dollar value or dirty data. |
| | Consistent | Do values represent the same meaning across systems and files? | Certain attributes has inconsistency across files and hence led to data misinterpretation. |
| Content within data values | Complete | Is all necessary data present? | A lot of data entries were missing. There were null values for week in ccount, sales in movement file, etc. |
| | Accurate | Does the data accurately represent reality or a verifiable source? | The movement file we used was Done-CHE.csv. This table contained a lot of junk values. The records with value of "OK" field set as 0 were inaccurate. |
| | Valid | Do data values fall within acceptable ranges defined by the business? | The file used was Store.csv. The file still contained information on stores which were closed. |
| | Fit For Purpose | Is the information valuable to the business? Does the data convey information that can intelligently be consumed by the business? | The file used was UPCCHE.csv. The UPC number was in a format which was not suitable for lookup operations in the warehouse. |

Table 4.1.1: Data Quality Issues

4.2 ETL Development Plan

An ETL Development Plan was designed to frame the roadmap for the data load process into the data warehouse. After determining the target data and source data, we mapped the tables for

staging and data mart loads by using comprehensive data extraction rules. We have attached the screen shots for the same displaying the data transformation and cleansing rules. The steps followed in ETL process are as below -

4.2.1 Target Data Required in Data Warehouse

We need six table in Data Warehouse area. They are categorized as below -

Four Dimension tables

1. dimTime
2. dimStore
3. dimProduct
4. dimCategory

Two Fact Tables

1. factProductMargin
2. factCategorySales

4.2.2 Source Data Required in Data Warehouse

We need the below data files

1. CCount.csv for category data
2. Done-CHE.csv for product transaction data
3. Store.csv for store data
4. Week_Decode.csv for time data
5. UPCCHE.csv for product information

4.2.3 ETL Specific Mapping Tables

These are required to map source data to target data. ETL specific mapping tables are extension of Mappings establish in section 3.2.7. Mapping tables provide in detail the flow of source data into staging area table which then flows into data warehouse tables.

Source to Staging Mapping Tables

This includes intermediate mapping from raw extracted file to intermediate tables with cleaned data. These intermediate tables are not temporary table. They are essential for storing and loading data to dimension and fact table.

| Staging Table | Staging Attribute | Used | DataType | Cleaned Staging Table | Cleaned Staging Table Attribute | DataType | Comments |
|---------------|--|-----------------|----------|-----------------------|---------------------------------|----------|----------------|
| CCount | Store | Yes | varchar | finalCCOUNT | Store | bigint | |
| CCount | Grocery | Yes | varchar | finalCCOUNT | Grocery | numeric | |
| CCount | Bakery | Yes | varchar | finalCCOUNT | Bakery | numeric | |
| CCount | Video | Yes | varchar | finalCCOUNT | Video | numeric | |
| CCount | Beer | Yes | varchar | finalCCOUNT | Beer | numeric | |
| CCount | Week | Yes | varchar | finalCCOUNT | Week | bigint | |
| CCOUNT | Dairy, Frozen, Bottle, Mvpclub, Groccoup, Meat, Meatfroz, Meatcoup, Fish, Fishcoup, Promo, Promcoup, Produce, Bulk, Saladbard, Prodoup, Bulkcoup, Salcoup, Floral, Flrcoup, Deli, Deliself, Deliexpr, Convfood, Cheese, Delicoup, , Pharmacy, Pharcoup, Gm, Jewelry, Cosmetic, Haba, Gmcoup, Camera, Photofin, , Videoren, Vidcoup, , Wine, Spirits, Miscscp, Mancoup, Custcoup, Ftgchin, Ftgcoup, Ftgital, Ftgicoup, Daircoup, Frozcoup, Habacoup, Photcoup, Cosmcoup, Ssdelicp, Bakcoup, Liqcoup | No | | | | | |
| finalCCOUNT | Store | No | | | | | |
| finalCCOUNT | Grocery | Yes | numeric | tempCategory | Category Name | | |
| finalCCOUNT | Bakery | Yes | numeric | tempCategory | | | |
| finalCCOUNT | Video | Yes | numeric | tempCategory | | | |
| finalCCOUNT | Beer | Yes | numeric | tempCategory | | | |
| finalCCOUNT | Week | No | | | | | |
| UPCCHE | Com_Code | No | | | | | |
| UPCCHE | Upc | Yes | varchar | UPC | Upc | bigint | |
| UPCCHE | Descrip | Yes | varchar | UPC | Descrip | varchar | |
| UPCCHE | Size | No | | | | | |
| UPCCHE | Case | No | | | | | |
| UPCCHE | Nitem | No | | | | | |
| Done-WCHE | Store | Yes | varchar | finalMovement | Store | bigint | |
| Done-WCHE | UPC | Yes | varchar | finalMovement | UPC | bigint | |
| Done-WCHE | Week | Yes | varchar | finalMovement | Week | bigint | |
| Done-WCHE | Move | Yes | varchar | finalMovement | Move | bigint | |
| Done-WCHE | QTY | Yes | varchar | finalMovement | QTY | bigint | |
| Done-WCHE | Price | Yes | varchar | finalMovement | Price | real | |
| Done-WCHE | Sale | No | | | | | |
| Done-WCHE | Profit | Yes | varchar | finalMovement | Profit | real | |
| Done-WCHE | Ok | For Calculation | | finalMovement | Ok | bigint | |
| | | | | finalMovement | Product Sales | real | Derived Column |

Table 4.2.1: Source to Staging Mapping Table

Staging to Data Warehouse Mapping Tables

| Staging Table | Staging Attribute | Used | DataType | Warehouse Table | Warehouse Attribute | DataType | Comments |
|---------------------|-------------------|----------------|----------|--------------------------|---------------------|----------|-------------------------------|
| Week_Decode | Week# | Yes | bigint | dimTime | Week_Num | bigint | |
| Week_Decode | Start | For Derivation | date | | | | |
| Week_Decode | End | No | date | | | | |
| Week_Decode | Special Events | Yes | varchar | dimTime | Week_Event | varchar | |
| | | | | dimTime | Year | int | Derived from Start |
| | | | | dimTime | Month | int | Derived from Start |
| | | | | dimTime | Time_ID | bigint | Surrogate Key |
| Store | Store | Yes | varchar | dimStore | Store_Num | bigint | |
| Store | City | Yes | varchar | dimStore | Store_City | varchar | |
| Store | Price Tier | Yes | varchar | dimStore | Store_Tier | varchar | |
| Store | Zone | No | | | | | |
| Store | Zip | No | | | | | |
| Store | Address | No | | | | | |
| | | | | dimStore | Store_ID | bigint | Surrogate Key |
| UPC | Upc | Yes | bigint | dimProduct | UPC_Num | bigint | |
| UPC | Descrip | Yes | varchar | dimProduct | Product_Name | varchar | |
| | | | | dimProduct | Product_key | bigint | Surrogate Key |
| tempCategory | Category Name | Yes | varchar | dimCategory | Category_Name | varchar | |
| | | | | dimCategory | Category_Key | bigint | Surrogate Key |
| | | | | factCategorySales | Sales | real | Aggregated from finalCCount |
| | | | | factProductMargin | Product Sales | real | Aggregated from finalMovement |

Table 4.2.2: Staging to Data Warehouse Mapping Table

4.2.4 Data Extraction Rules

Data extraction involves mining data from various data sources. It is the first step in the ETL process. The simple rule that has been followed in this project is to dump all source data in staging area as it is and then clean it.

Data was extracted from source files mentioned in **Section 4.2.2** and was convert to tables in SQL Server. All the source files we used in data extractions were .csv files.

All the loaded was loaded into staging area 602Group6_stagingDB.

4.2.5 Data Transformation and Cleaning Rules

Data Quality issues have been discussed in **Section 4.1**. To remove these issues and prepare data to be fit for analysis data cleaning and transformation exercise was performed. Data cleaning and transformation follows immediately after Data Extraction.

Each of the data quality issue was handled as per below rules-

1. Dirty Data

Records with any dirty data were removed. Record with any field value equal to “.” was removed. Records with Week as negative values were removed.

2. Null Values

Records with Null values or blank values in any of the fields were removed.

3. Data Conversion

All text attributes were converted to varchar format. Number attributes such as Week_Num, Year, Month were converted to int. Measures such as sales were converted to numeric format.

5. Creation of Derived Attributes

Product profit margins were derived from existing data fields. The profit margin for each record is calculated using the formulae ((move*price/ qty)*profit/100).

4. Surrogate Key

Surrogate keys were defined for all records. All surrogate keys were stored as bigint.

Functions that were used for Data Cleaning and Transformation are as below –

- Unpivot- It is used for making a dataset more normalized by expanding the single record into multiple records with same value in single column.
- Pivot- It is used for making a dataset less normalized by compacting multiple records into single record.
- Lookup- It performs lookups by joining data in input columns with columns in a reference dataset.
- Derived Column- It creates new column values by applying transformation to the input columns.
- Data Conversion- It converts the data type of a column to another desired data type.
- Aggregate- It applies aggregate functions like sum, average, group by to the input columns and produce transformed columns.

ETL Implementation in **Section 4.3** provides detailed execution of the plan.

4.2.6 Form Aggregate Tables

Two aggregate operations have been used to create the two fact tables.

- Category Sales Fact table has been grouped by Time, Store and Category key and sum operation is applied on sales
- Product Margin Fact table has been group by Time and Product key and sum operation is applied on profit

ETL Implementation of fact tables in **Section 4.3.1** provides detailed execution of the plan.

4.2.7 Load the data

After all data has been cleaned, the staging area tables acts as a feeder to data warehouse dimension and fact tables.

All data has been loaded into 602Group6_DW_Area.

Data loading has been covered for each table in detail in **Section 4.3.2**

4.3 ETL Implementation

4.3.1 Extraction and Transformation of Source Data in Staging Area

4.3.1.1 Extraction and Transformation for Store Dimension Creation

The first step in this process is to create the staging area 602Group6_stagingDB. This step is automatically completed when we import our first file Store.csv to the staging area through a SSIS package.

Data Extraction

The first step in this process is to create the staging area 602Group6_stagingDB. This step is automatically completed when we import our first file Store.csv to the staging area through a SSIS package.

Extract Store.csv file to Staging Area

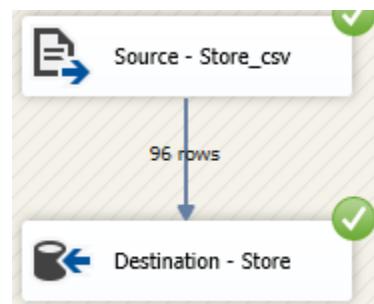

Figure 4.3-1: Extract Store.csv file to Staging Area

Snapshot of Store Table in Staging Area

The screenshot shows a SQL query window in SSMS. The query is:

```
/* Script for SelectTopNRows command from SSMS */
SELECT TOP (1000) [Store]
,[City]
,[Price Tier]
,[Zone]
,[Zip]
,[Address]
FROM [602Group6_stagingDB].[dbo].[Store]
```

The results pane displays the following data:

| | Store | City | Price Tier | Zone | Zip | Address |
|----|-------|--------------|------------|------|-------|-----------------------|
| 1 | 2 | River Forest | High | 1 | 60305 | 7501 W. North Ave. |
| 2 | 4 | Park Ridge | Medium | 2 | 60068 | Closed |
| 3 | 5 | Palatine | Medium | 2 | 60067 | 223 Northwest HWY. |
| 4 | 8 | Oak Lawn | Low | 5 | 60435 | 8700 S. Cicero Ave. |
| 5 | 9 | Morton Grove | Medium | 2 | 60053 | 6931 Dempster |
| 6 | 12 | Chicago | High | 7 | 60660 | 6009 N. Broadway Ave. |
| 7 | 14 | Glenview | High | 1 | 60025 | 1020 Waukegan Rd. |
| 8 | 18 | River Grove | Low | 5 | 60171 | 8355 W. Belmont Ave. |
| 9 | 19 | Glen Ellyn | | | 60137 | Closed |
| 10 | 21 | Hanover Park | CubFighter | 6 | 60103 | 1440 Irving Park Rd. |

Figure 4.3-2: Snapshot of Store Table in Staging Area

Data Transformation

Transformation of Store Table to dimStore

1. Select only Store, City and Price Tier from Store table where address of store is not marked as Closed

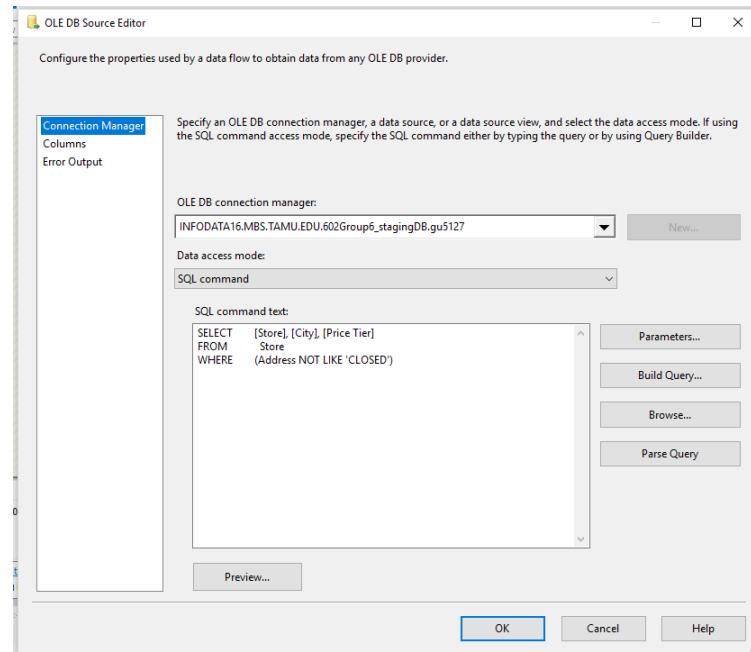

Figure 4.3-3: Selecting attributes from Store table

2. Convert Store from datatype varchar to a Converted Store with datatype bigint

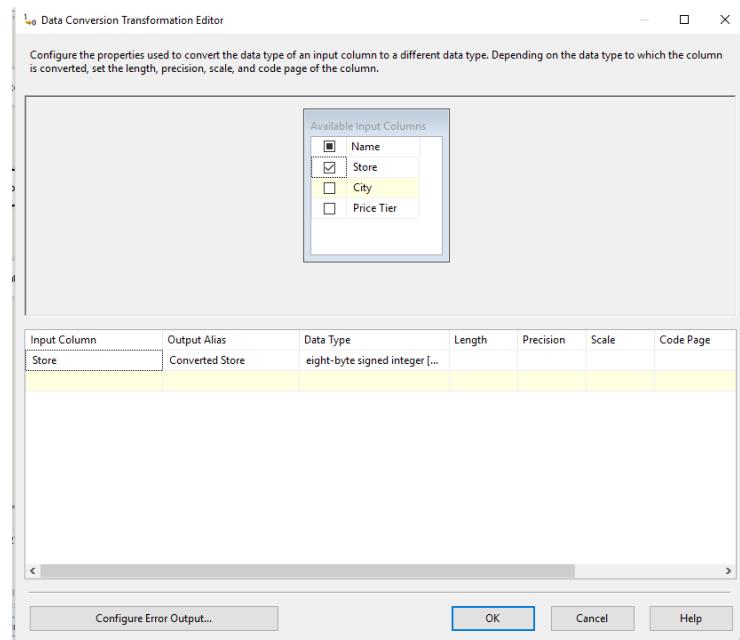

Figure 4.3-4: Converting Data Type of Store

4.3.1.2 Extraction and Transformation for Time Dimension

Data Extraction

Extract Week_Decode.csv file to Staging Area

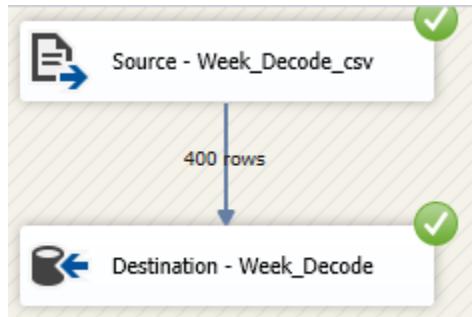

Figure 4.3-5: Extract Week_Decode.csv file to Staging Area

Snapshot of Week Decode Table in Staging Area

The screenshot shows a Microsoft SQL Server Management Studio (SSMS) window. The query pane displays a T-SQL script:

```
***** Script for SelectTopNRows command from SSMS *****
SELECT TOP (1000) [ Week # ]
      ,[Start]
      ,[End]
      ,[Special Events]
  FROM [602Group6_stagingDB].[dbo].[Week_Decode]
```

The results pane shows the output of the query:

| | Week # | Start | End | Special Events |
|----|--------|------------|------------|----------------|
| 1 | 1 | 9/14/1989 | 9/20/1989 | |
| 2 | 2 | 9/21/1989 | 9/27/1989 | |
| 3 | 3 | 9/28/1989 | 10/4/1989 | |
| 4 | 4 | 10/5/1989 | 10/11/1989 | |
| 5 | 5 | 10/12/1989 | 10/18/1989 | |
| 6 | 6 | 10/19/1989 | 10/25/1989 | |
| 7 | 7 | 10/26/1989 | 11/1/1989 | Halloween |
| 8 | 8 | 11/2/1989 | 11/8/1989 | |
| 9 | 9 | 11/9/1989 | 11/15/1989 | |
| 10 | 10 | 11/16/1989 | 11/22/1989 | |

Figure 4.3-6: Snapshot of Week_Decode Table in Staging Area

Data Transformation

Week _Decode table to dimTime in Data Warehouse

1. Transform Start and End fields to date datatype from varchar. Also transform Week # to bigint datatype from varchar

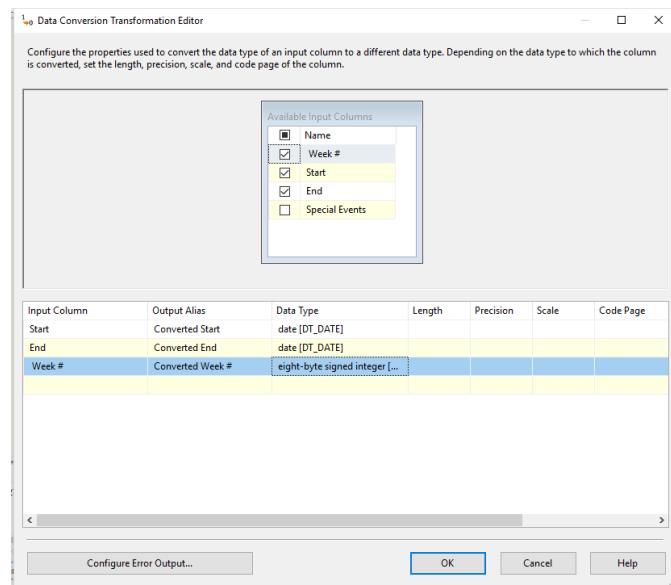

Figure 4.3-7: Transforming datatypes in Week_Decode

2. Derive Year and Month from Start field

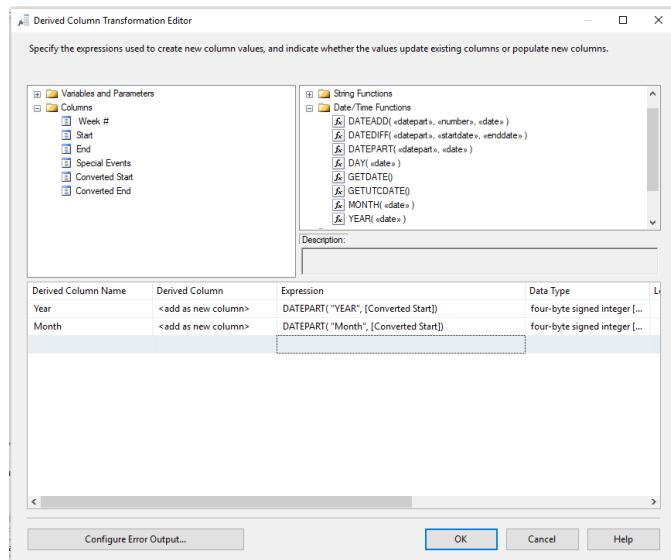

Figure 4.3-8: Deriving attributes in Week_Decode

4.3.1.3 Extraction and Transformation for Category Dimension

The csv file CCOUNT is used to create the category Dimension. This dimension will contain the sales amount for the categories Bakery, Beer, Grocery and Videos along with Date, Week and Store number.

Data Extraction

Extract CCount.csv file to Staging Area

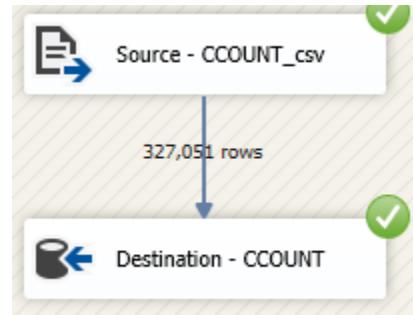

Figure 4.3-9: Extract CCount.csv to staging area

Snapshot of CCount Table in Staging Area

A screenshot of a SQL query results window. The query is "select * from CCOUNT". The results grid shows 10 rows of data corresponding to store 59. The columns represent various product categories and their sales figures. The last row shows a total value of 6715.37.

| | "STORE" | "DATE" | "GROCERY" | "DAIRY" | "FROZEN" | "BOTTLE" | "MVPCLUB" | "GROCCOUP" | "MEAT" | "MEATFROZ" | "MEATCOUP" | "FISH" | "FISHCOUP" | "PROMO" | "PROMCOUP" | "PRODUCE" | "BULK" | "SALADBAR" | "PRO" |
|----|---------|----------|-----------|---------|----------|----------|-----------|------------|---------|------------|------------|---------|------------|---------|------------|-----------|--------|------------|-------|
| 1 | 59 | "950209" | 21657.91 | 4678.37 | 4143.88 | 0 | 319.44 | -779.49 | 5877.19 | 763.35 | 0 | 857.95 | 0 | 0 | 0 | 5382.21 | 695.45 | 157.18 | -3.3 |
| 2 | 59 | "950210" | 23671.27 | 5105.01 | 4467.24 | 0 | 245.56 | -720.64 | 6257.17 | 923.45 | 0 | 1200.22 | 0 | 0 | 0 | 6378.12 | 770.85 | 161.81 | -3.2 |
| 3 | 59 | "950211" | 30531.72 | 6811.52 | 5963.35 | 0 | 341.92 | -718.31 | 7308.45 | 1117.14 | -2 | 1276.88 | 0 | 0 | 0 | 7543.23 | 786.6 | 206.07 | -5.7 |

Figure 4.3-10: Snapshot of CCount Table in Staging Area

Data Transformation

1. Clean CCount file with the following transformations

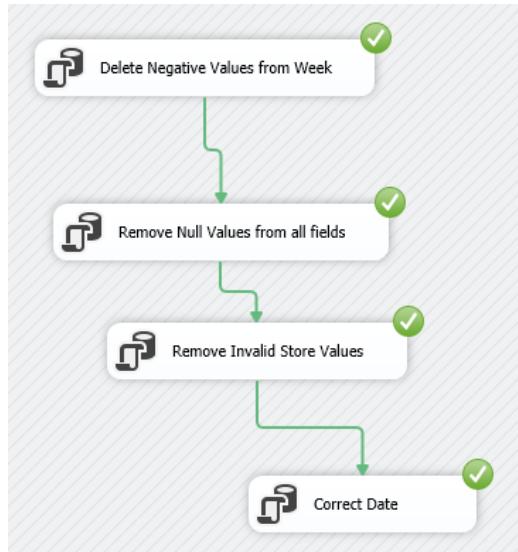

Figure 4.3-11: Clean CCount

2. Select required categories from CCount

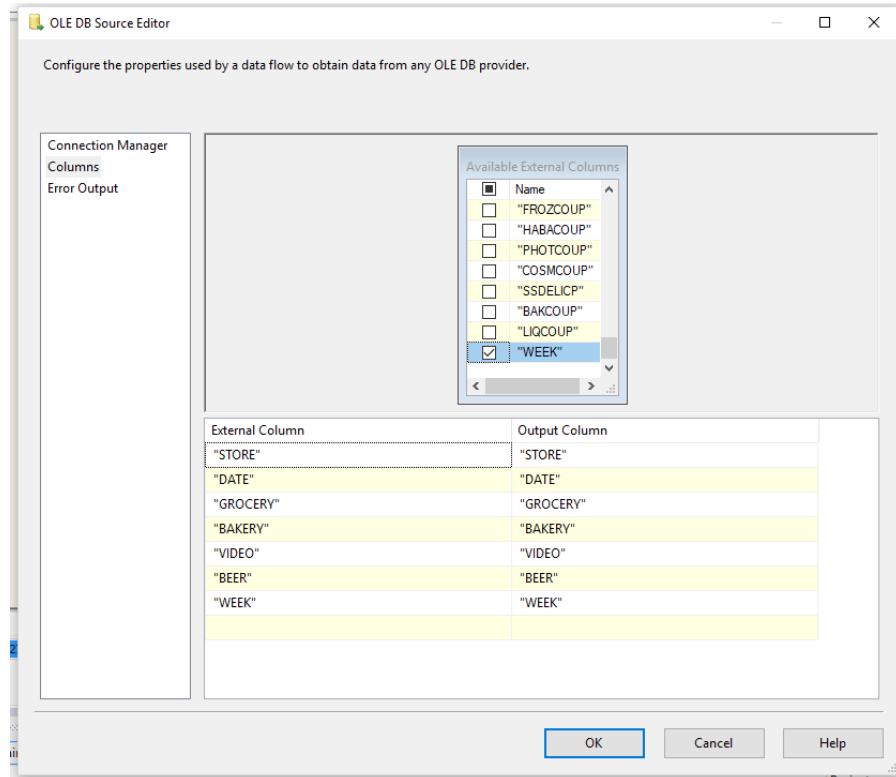

Figure 4.3-12: Selecting required categories from CCount

3. Create finalCCount file with required datatypes

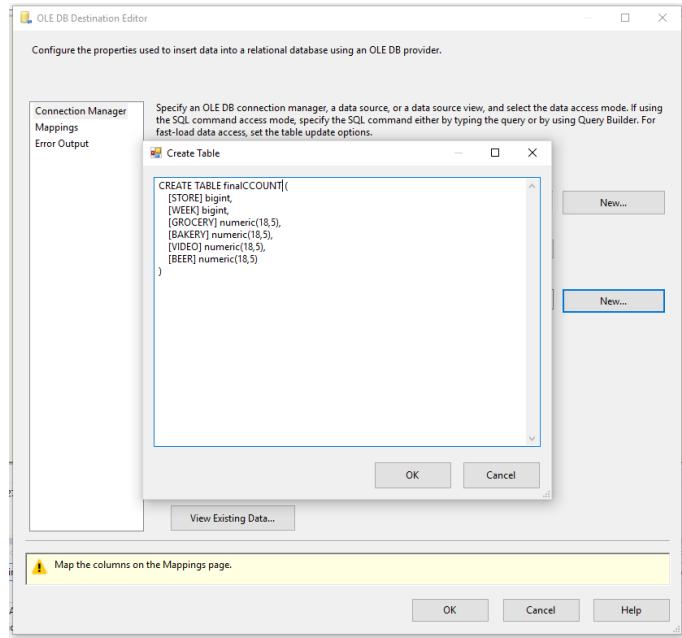

Figure 4.3-13: Creating finalCCount with required attributes

4. Map the fields to correct data types

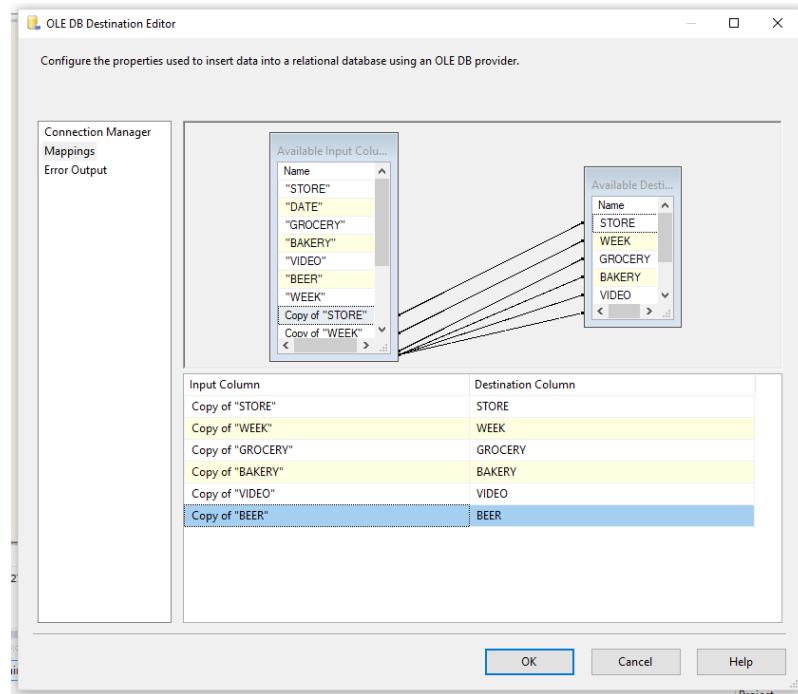

Figure 4.3-14: Mapping CCount fields to correct datatypes

5. Execute the package

Figure 4.3-15: Executing finalCCount table

6. Create a temporary Category table in Staging Area to store the Category Names

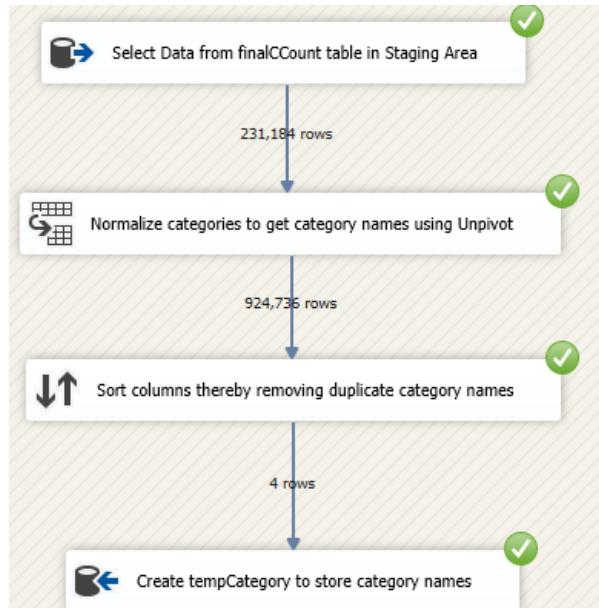

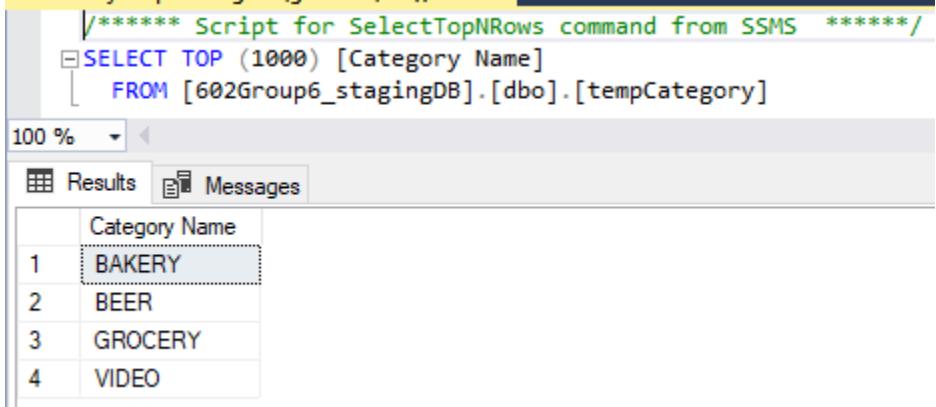

Figure 4.3-16: Creating temporary Category table in Staging Area

Snapshot of tempCategory Table in Staging Area

The screenshot shows a SQL Server Management Studio (SSMS) window. The title bar says "***** Script for SelectTopNRows command from SSMS *****". The query pane contains the following T-SQL code:

```
SELECT TOP (1000) [Category Name]
FROM [602Group6_stagingDB].[dbo].[tempCategory]
```

The results pane shows a table with one column "Category Name" and four rows:

| | Category Name |
|---|---------------|
| 1 | BAKERY |
| 2 | BEER |
| 3 | GROCERY |
| 4 | VIDEO |

Figure 4.3-17: Snapshot of tempCategory Table in Staging Area

4.3.1.4 Extraction and Transformation for Product Dimension

Data Extraction

Extract UPCCHE to Staging Area

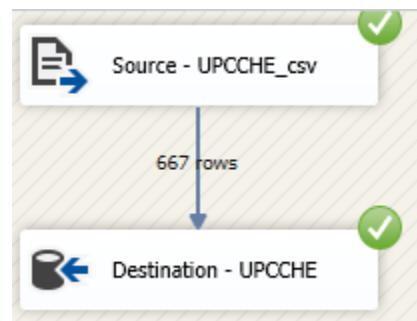

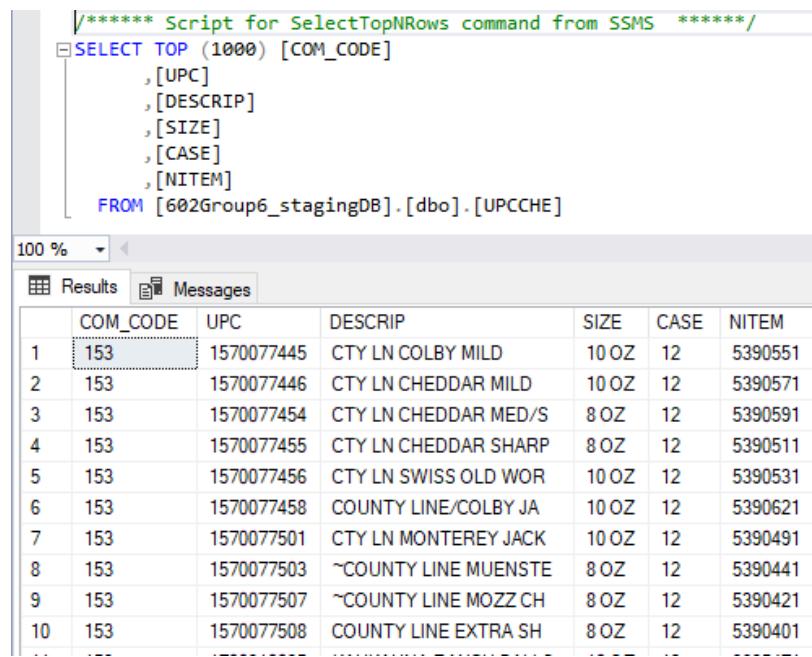

Figure 4.3-18: Extract UPCCHE to Staging Area

UPCCHE file in Staging Area

The screenshot shows a SQL Server Management Studio window. At the top, there is a script pane containing the following T-SQL code:

```
***** Script for SelectTopNRows command from SSMS *****/
SELECT TOP (1000) [COM_CODE]
, [UPC]
, [DESCRIP]
, [SIZE]
, [CASE]
, [NITEM]
FROM [602Group6_stagingDB].[dbo].[UPCCHE]
```

Below the script pane is a results grid titled "Results". The grid displays 10 rows of data from the UPCCHE table, with the first row highlighted. The columns are labeled: COM_CODE, UPC, DESCRIP, SIZE, CASE, and NITEM. The data includes various cheese products like Colby Mild, Cheddar Mild, and Swiss Old Wor.

| | COM_CODE | UPC | DESCRIP | SIZE | CASE | NITEM |
|----|----------|------------|----------------------|-------|------|---------|
| 1 | 153 | 1570077445 | CTY LN COLBY MILD | 10 OZ | 12 | 5390551 |
| 2 | 153 | 1570077446 | CTY LN CHEDDAR MILD | 10 OZ | 12 | 5390571 |

6. Aggregate Sales Data

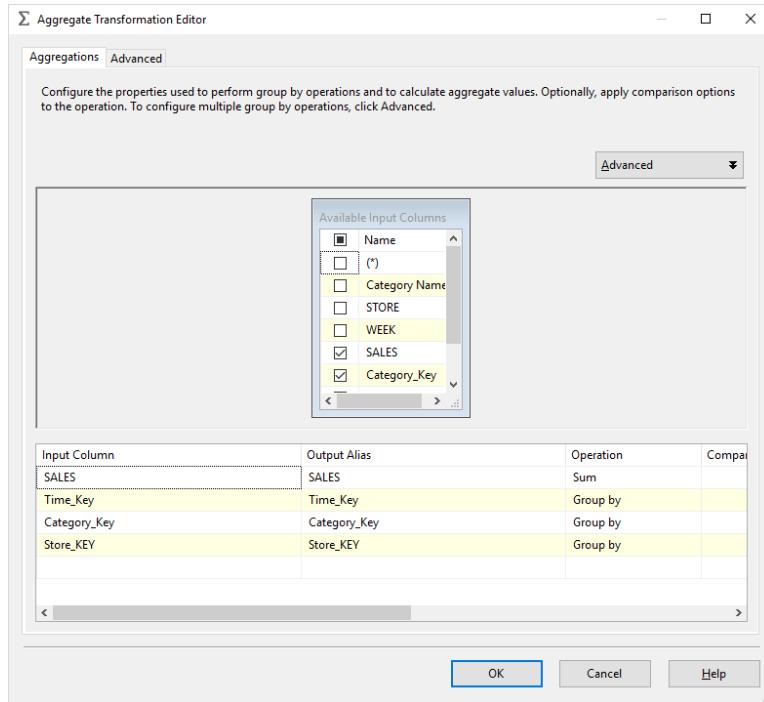

Figure 4.3-31: Aggregate Sales Data

4.3.2 Loading of Dimension and Fact Tables from Staging to DW Area

4.3.2.1 Data Loading

Data loading is the process of moving the data from staging area to the Data Warehouse. The phrases related to data loading are:

- Initial load: This is when the Data warehouse tables are loaded for the first time. This was the type of Data Loading we performed in our project.
- Incremental load: This is when any update, delete or insert occurs in the source database and those changes are applied to the data warehouse in a period manner. We did not perform this loading in our project.
- Full Refresh: This is when the entire data warehouse data is deleted and reloaded with fresh data. We did not require a full refresh anytime while data loading in this project.

The data loading process for our project has been depicted in Figure 4.3-24.

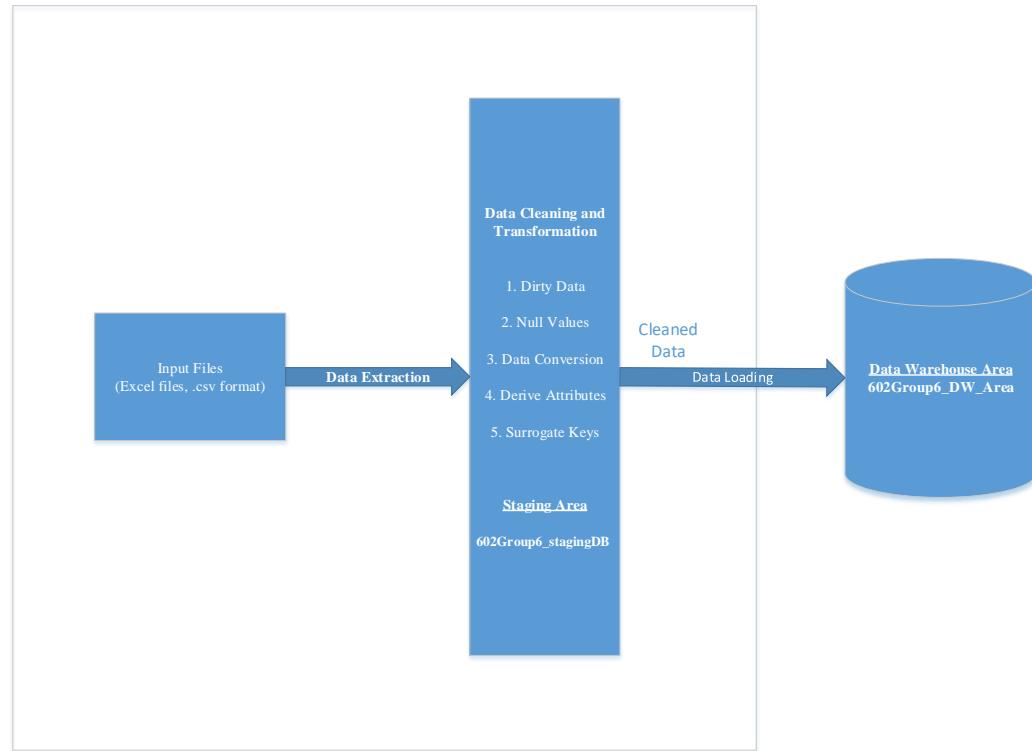

Figure 4.3-32: Data Loading Process

4.3.2.2 Data Loading for Store Dimension

1. Create Dimension table dimStore along with a surrogate key for each record in Data Warehouse

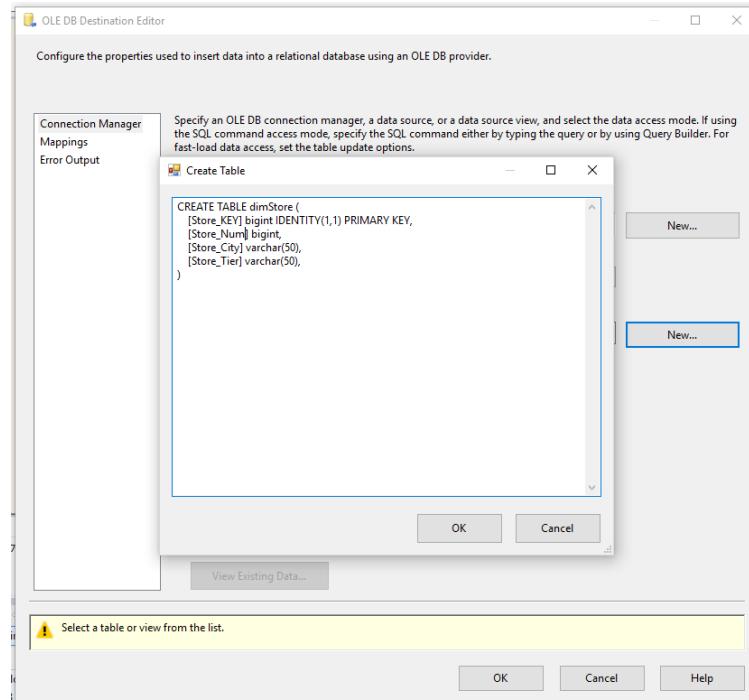

Figure 4.3-33: Creating dimStore

2. Map fields into dimStore

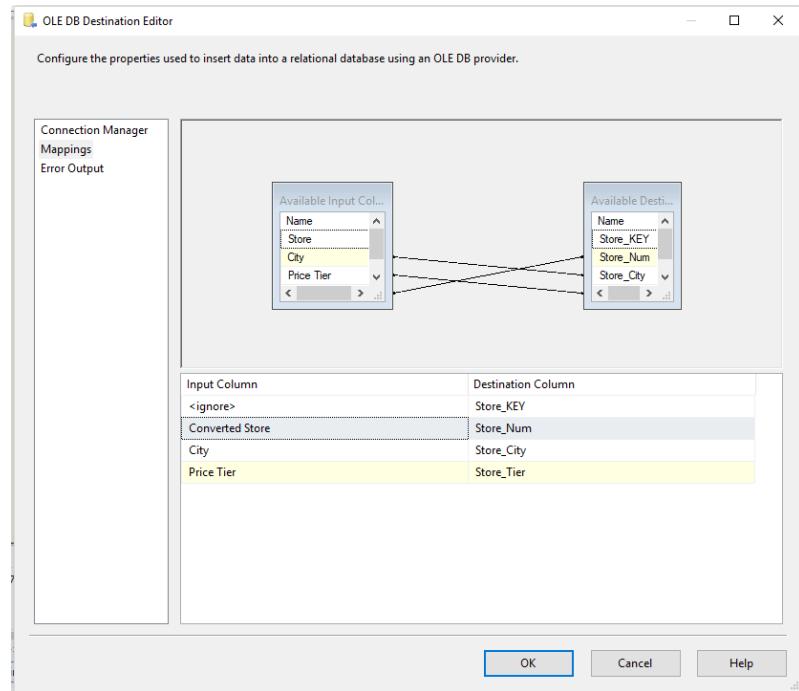

Figure 4.3-34: Mapping attributes from Staging area to dimStore

3. Execute the package

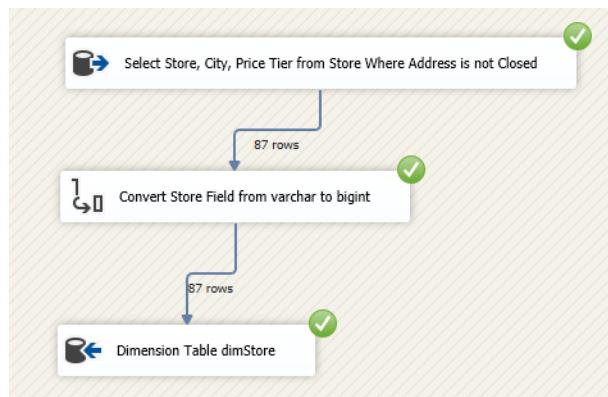

Figure 4.3-35: Execute dimStore Package

Snapshot of dimStore Dimension Table

The screenshot shows a SQL query window with the following script:

```
V***** Script for SelectTopNRows command from SSMS *****  
SELECT TOP (1000) [Store_KEY]  
    ,[Store_Num]  
    ,[Store_City]  
    ,[Store_Tier]  
FROM [602Group6_DW_Area].[dbo].[dimStore]
```

The results grid displays 10 rows of data:

| | Store_KEY | Store_Num | Store_City | Store_Tier |
|----|-----------|-----------|--------------|------------|
| 1 | 175 | 2 | River Forest | High |
| 2 | 176 | 5 | Palatine | Medium |
| 3 | 177 | 8 | Oak Lawn | Low |
| 4 | 178 | 9 | Morton Grove | Medium |
| 5 | 179 | 12 | Chicago | High |
| 6 | 180 | 14 | Glenview | High |
| 7 | 181 | 18 | River Grove | Low |
| 8 | 182 | 21 | Hanover Park | CubFighter |
| 9 | 183 | 28 | Mt. Prospect | Medium |
| 10 | 184 | 32 | Park Ridge | High |

Figure 4.3-36: Snapshot of dimStore Dimension Table

4.3.2.3 Data Loading for Time Dimension

1. Create dimTime along with a surrogate key for each record

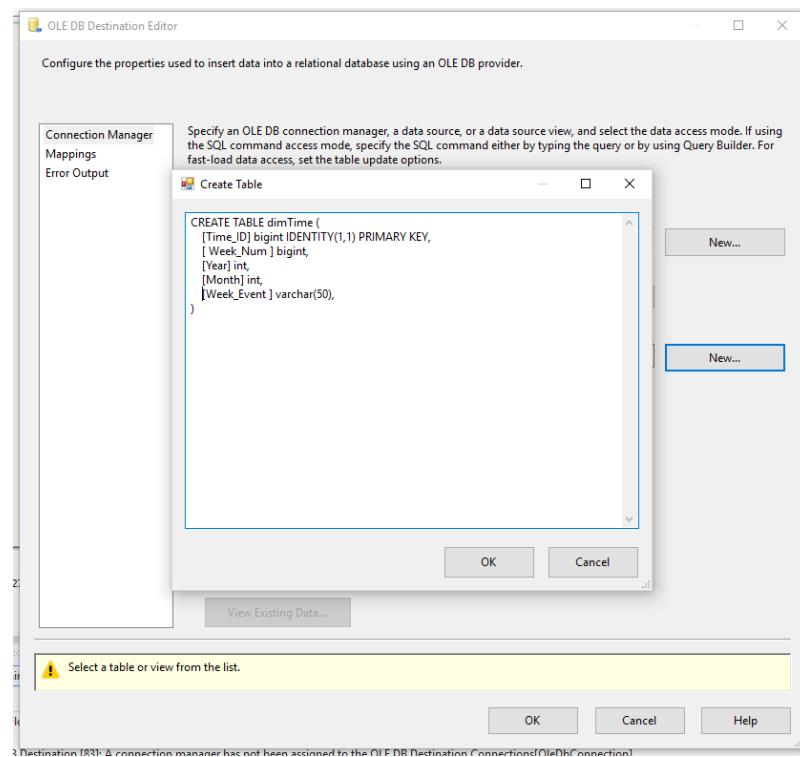

Figure 4.3-37: Creating dimTime with surrogate key

2. Map fields into dimTime

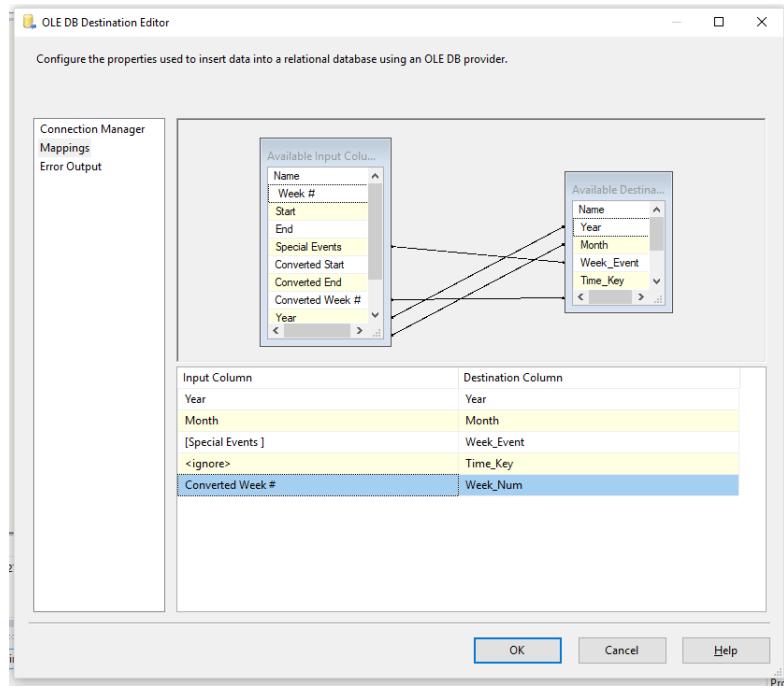

Figure 4.3-38: Mapping data from staging area to dimTime

3. Execute the package

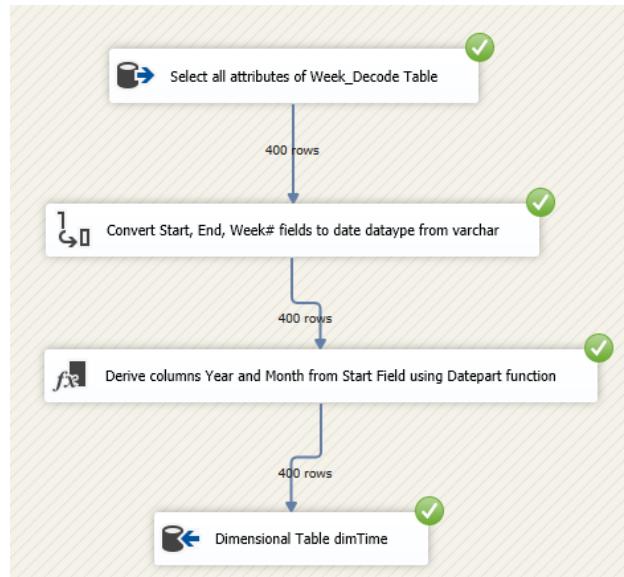

Figure 4.3-39: Executing dimTime package

Snapshot of dimTime Dimension Table

The screenshot shows a SQL Server Management Studio (SSMS) window. At the top, there is a script pane containing a T-SQL query:

```
***** Script for SelectTopNRows command from SSMS *****/
SELECT TOP (1000) [Time_Key]
      ,[Week_Num]
      ,[Year]
      ,[Month]
      ,[Week_Event ]
  FROM [602Group6_DW_Area].[dbo].[dimTime]
```

Below the script pane is a results grid titled "Results". The grid displays 10 rows of data from the dimTime table, with the first row highlighted. The columns are labeled: Time_Key, Week_Num, Year, Month, and Week_Event. The Week_Event column for the 7th row contains the value "Halloween".

| | Time_Key | Week_Num | Year | Month | Week_Event |
|----|----------|----------|------|-------|------------|
| 1 | 1601 | 1 | 1989 | 9 | |
| 2 | 1602 | 2 | 1989 | 9 | |
| 3 | 1603 | 3 | 1989 | 9 | |
| 4 | 1604 | 4 | 1989 | 10 | |
| 5 | 1605 | 5 | 1989 | 10 | |
| 6 | 1606 | 6 | 1989 | 10 | |
| 7 | 1607 | 7 | 1989 | 10 | Halloween |
| 8 | 1608 | 8 | 1989 | 11 | |

4.3.2.5 Data Loading for Product Dimension

1. Create dimProduct in DataWarehouse

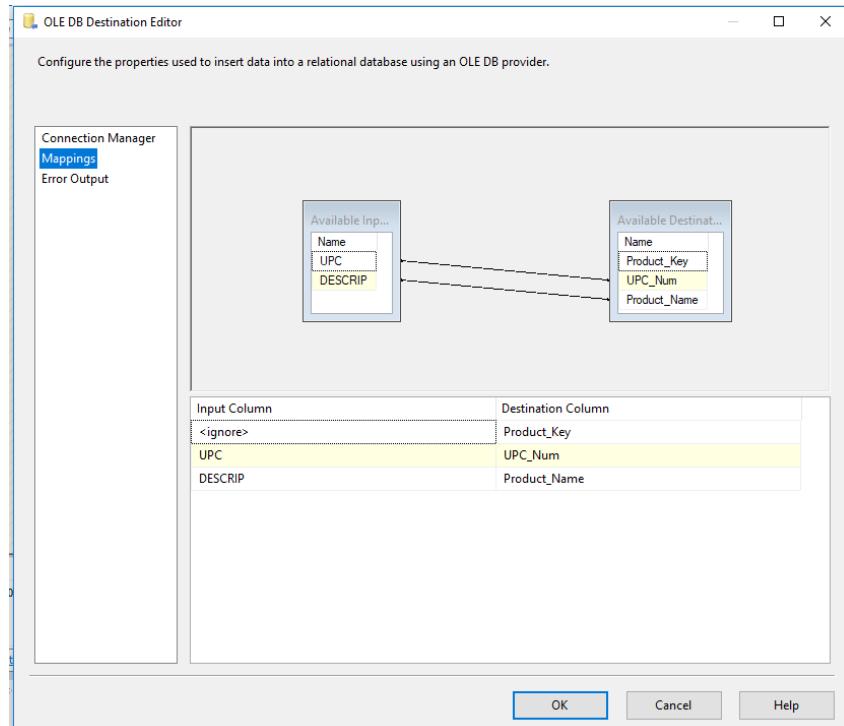

Figure 4.3-43: Mapping attributes from UPCCHE to dimProduct

2. Load the data from UPC table in Staging Area

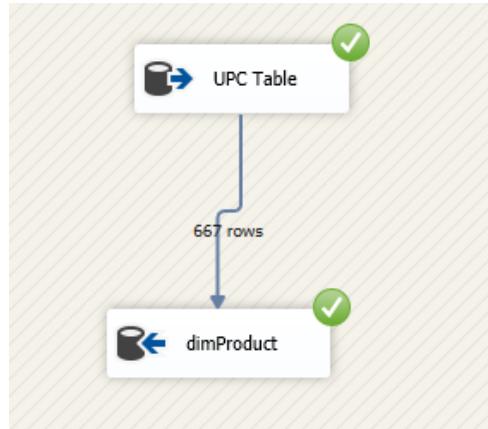

Figure 4.3-44: Loading data in dimProduct

Snapshot of dimProduct Dimension Table

The screenshot shows a SQL Server Management Studio (SSMS) window. The query pane displays a T-SQL script:

```
/* ***** Script for SelectTopNRows command from SSMS *****/
SELECT TOP (1000) [Product_Key]
, [UPC_Num]
, [Product_Name]
FROM [602Group6_DW_Area].[dbo].[dimProduct]
```

The results pane shows the output of the query, which is a table with three columns: Product_Key, UPC_Num, and Product_Name. The data consists of 10 rows, each representing a different product with its key, UPC number, and name.

| | Product_Key | UPC_Num | Product_Name |
|----|-------------|------------|----------------------|
| 1 | 1 | 1570077445 | CTY LN COLBY MILD |
| 2 | 2 | 1570077446 | CTY LN CHEDDAR MILD |
| 3 | 3 | 1570077454 | CTY LN CHEDDAR MED/S |
| 4 | 4 | 1570077455 | CTY LN CHEDDAR SHARP |
| 5 | 5 | 1570077456 | CTY LN SWISS OLD WOR |
| 6 | 6 | 1570077458 | COUNTY LINE/COLBY JA |
| 7 | 7 | 1570077501 | CTY LN MONTEREY JACK |
| 8 | 8 | 1570077503 | ~COUNTY LINE MUENSTE |
| 9 | 9 | 1570077507 | ~COUNTY LINE MOZZ CH |
| 10 | 10 | 1570077508 | COUNTY LINE EXTRA SH |

Figure 4.3-45: 3. Snapshot of dimProduct Dimension Table

4.3.2.6 Data Loading for factProductMargin Fact Table

Execute the package

Figure 4.3-46: Product Margin Fact Table

Snapshot of factProductMargin Fact Table

The screenshot shows the results of a SQL query against the factProductMargin fact table. The query is:

```
***** Script for SelectTopNRows command from SSMS *****/
SELECT TOP (1000) [Product Sales]
      ,[Product_Key]
      ,[Time_Key]
  FROM [602Group6_DW_Area].[dbo].[factProductMargin]
```

The results are displayed in a table with three columns: Product Sales, Product_Key, and Time_Key. The data is as follows:

| | Product Sales | Product_Key | Time_Key |
|----|------------------|-------------|----------|
| 1 | 1091.73003935814 | 1 | 1601 |
| 2 | 1831.60006833076 | 2 | 1601 |
| 3 | 931.000011444092 | 3 | 1601 |
| 4 | 2668.25989532471 | 4 | 1601 |
| 5 | 2973.16015386581 | 5 | 1601 |
| 6 | 1064.80002403259 | 6 | 1601 |
| 7 | 1122.30004024506 | 7 | 1601 |
| 8 | 1197.66998291016 | 23 | 1601 |
| 9 | 7.44999980926514 | 24 | 1601 |
| 10 | 3.49000000953674 | 25 | 1601 |

Figure 4.3-47: Snapshot of factProductMargin Fact Table

4.3.2.7 Data Loading for factProductMargin Fact Table

Execute the package

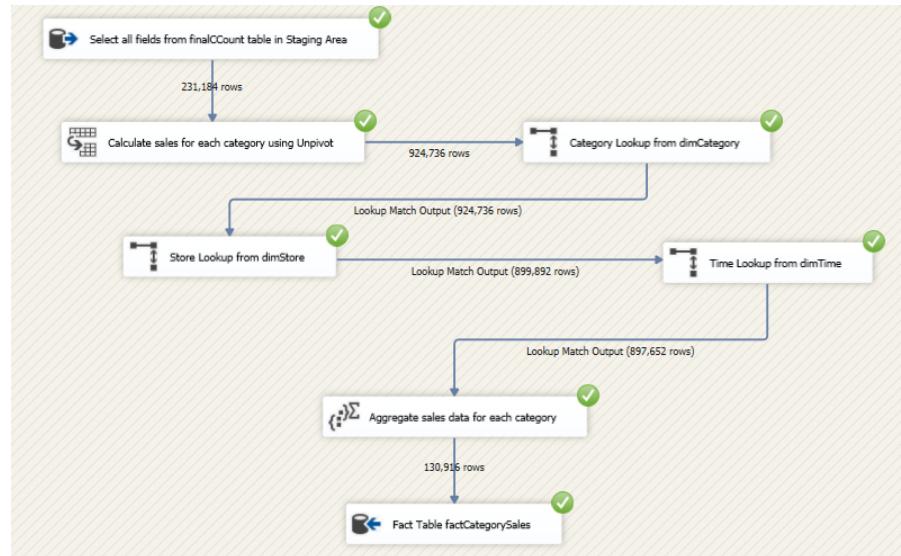

Figure 4.3-48: Category Sales fact table

Snapshot of factCategorySales Fact Table

A screenshot of SQL Server Management Studio (SSMS) showing a query results window. The query is:

```
***** Script for SelectTopNRows command from SSMS *****/
SELECT TOP (1000) [SALES]
, [Time_Key]
, [Category_Key]
, [Store_KEY]
FROM [602Group6_DW_Area].[dbo].[factCategorySales]
```

The results window displays 10 rows of data:

| | SALES | Time_Key | Category_Key | Store_KEY |
|----|-------------|----------|--------------|-----------|
| 1 | 11660.70000 | 1601 | 5 | 175 |
| 2 | 11895.54000 | 1601 | 5 | 176 |
| 3 | 13221.39000 | 1601 | 5 | 177 |
| 4 | 12215.39000 | 1601 | 5 | 178 |
| 5 | 7459.01000 | 1601 | 5 | 179 |
| 6 | 11430.82000 | 1601 | 5 | 180 |
| 7 | 15610.09000 | 1601 | 5 | 181 |
| 8 | 7542.47000 | 1601 | 5 | 182 |
| 9 | 7630.52000 | 1601 | 5 | 183 |
| 10 | 16710.37000 | 1601 | 5 | 184 |

4.3.3 SQL Queries Used in SSIS

4.3.3.1 Table Creation Commands in SSIS

The following commands were used during creation OLE DB Destination through SSIS for Staging Area and Data Warehouse. These commands need to be entered when we click on New button in OLE DB Destination.

dimCategory

```
CREATE TABLE dimCategory(
    Category_Key bigint IDENTITY(1,1) PRIMARY KEY,
    Category Name varchar,
)
```

dimProduct

```
CREATE TABLE dimProduct(
    Product_Key bigint IDENTITY(1,1) PRIMARY KEY,
    UPC_Num bigint,
    Product_Name varchar,
)
```

dimStore

```
CREATE TABLE dimStore(
    [Store_KEY] bigint IDENTITY(1,1) PRIMARY KEY,
    [Store_Num] bigint,
    [Store_City] varchar(50),
    [Store_Tier] varchar(50),
)
```

dimTime

```
CREATE TABLE dimTime(
    [Time_ID] bigint IDENTITY(1,1) PRIMARY KEY,
    [Week_Num] bigint,
    [Year] int,
    [Month] int,
    [Week_Event] varchar(50),
)
```

finalCCOUNT

```
CREATE TABLE finalCCOUNT(
```

```
[STORE] bigint,  
[WEEK] bigint,  
[GROCERY] numeric(18, 5),  
[BAKERY] numeric(18, 5),  
[VIDEO] numeric(18, 5),  
[BEER] numeric(18, 5)
```

finalMovement

```
CREATE TABLE finalMovement(  
    [STORE] bigint,  
    [UPC] bigint,  
    [WEEK] bigint,  
    [MOVE] bigint,  
    [QTY] bigint,  
    [PRICE] real,  
    [PROFIT] real,  
    [OK] bigint,  
    [Product Sales] real  
)
```

tempCategory

```
CREATE TABLE tempCategory(  
    [Category Name] varchar(255)  
)
```

UPC

```
CREATE TABLE UPC(  
    [COM_CODE] varchar(50),  
    [UPC] bigint,  
    [DESCRIP] varchar(50),  
    [SIZE] varchar(50),  
    [CASE] varchar(50)  
)
```

4.3.3.2 Data Cleaning Commands in SSIS

Commands to clean CCount file

Command Location – Control Flow

Delete Negative Values from Week

```
DELETE FROM CCOUNT  
WHERE      ("WEEK" LIKE '-%') OR
```

```
(["WEEK"] LIKE '.')
```

Remove Null Values from All fields

```
DELETE  
FROM CCOUNT  
WHERE (["WEEK"] IS NULL) OR  
(["VIDEO"] IS NULL) OR  
(["GROCERY"] IS NULL) OR  
(["BEER"] IS NULL) OR  
(["DATE"] IS NULL) OR  
(["STORE"] IS NULL) OR  
(["BAKERY"] IS NULL)
```

Remove Invalid Store Values

```
DELETE FROM CCOUNT  
WHERE (NOT (["STORE"] IN  
          (SELECT Store  
           FROM Store)))
```

Correct Date

```
UPDATE CCOUNT  
SET ["DATE"] = REPLACE(["DATE"], "", "")
```

```
DELETE FROM CCOUNT  
WHERE ["DATE"] LIKE 'a'
```

Commands to clean Store file

Command Location – Data Flow

```
Select only stores which are not “Closed”  
SELECT [Store], [City], [Price Tier]
```

```
FROM Store  
Where (Address NOT LIKE 'CLOSED')
```

Commands to clean Done-CHE table which is used to create UPC file

Command Location – Control Flow

```
Remove Records with Invalid “OK”  
DELETE  
FROM [DONE-WCHE]  
WHERE ["OK"] LIKE '0'
```

Remove Records with No Move

```

DELETE
FROM [DONE-WCHE]
WHERE ["MOVE"] LIKE '0'

```

4.3.4 Staging Area Tables after Removal of Temporary Tables

This is the final view of tables in staging area after removing all the temporary tables from staging area.

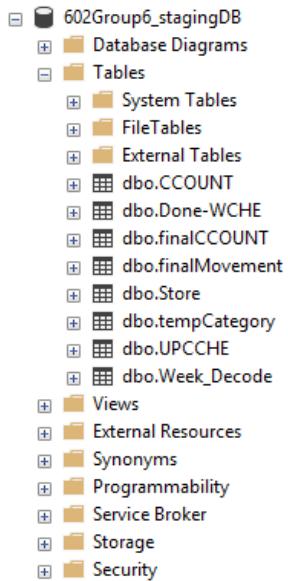

Figure 4.3-50: Staging area tables

4.3.5 Data Warehouse Area Tables

This is the final view of tables in data warehouse area after removing all the temporary tables from data warehouse area.

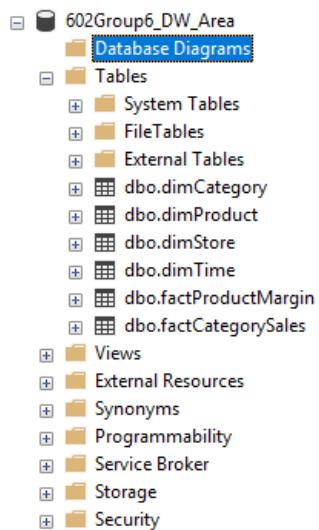

Figure 4.3-51: Data Warehouse Area tables

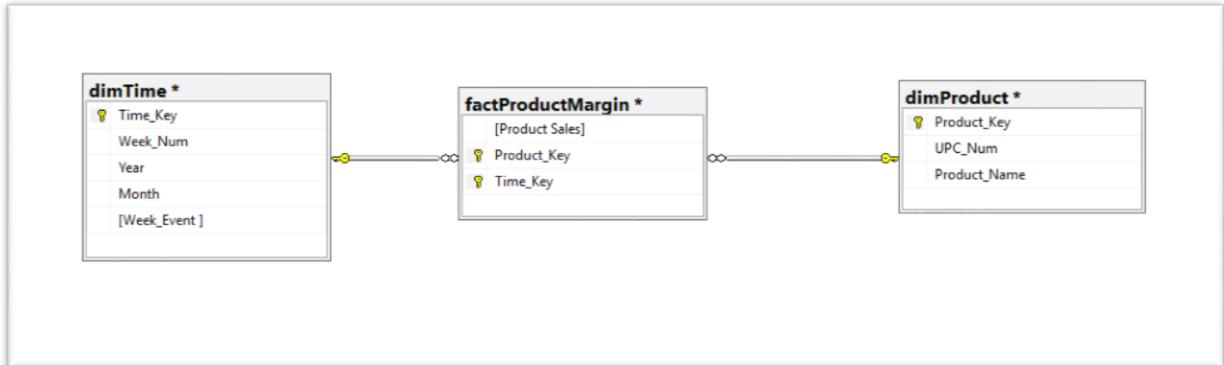

Figure 4.3-53: Table Structure for factProductMargin

5 BI reporting

5.1 Reporting Plan

This section lays out what reports will be generated for each of the business questions. We have decided to use Report Builder for Question 1 and Question 4. We will use SSRS only for Question

3 and SSAS only for Question 5. For SSAS only (Question 5) graph will be created through Report Builder. Report for Question 2 will be generated through SSRS on top on SSAS. The reporting plan is further explained in sections 5.1.1 to 5.1.4.

5.1.1 Target reports satisfying business questions

Q1. How are the sales of Bakery products affected during Christmas period over the period 1989 -1996?

Report generated from Report Builder 3.0

To solve this business question, we used the Category Name as BAKERY from the Category dimension, week number from Time dimension and week event as “Christmas” from the Time dimension and mapped them with the Category Sales fact table to get the Category sales. This will give the trend of Bakery sales during the Christmas week over the period 1989 -1996. We have made use of a bar chart to show the bakery trends.

Q2. Are there any periods during the years 1989-1995 where the video sales are higher or lower?

Report generated from SSRS on top of SSAS

This business question was answered by creating a cube in the Analytics Services of the SQL Server data tools. We have used the Category Sales fact table along with Time dimension table and Category dimension table. An SQL query was created to use Year and month from Time dimension, and Category Sales from the Category Sales fact table while putting the filter on Category name to get the values for Video category from category dimension. After successful deployment of the cube on server, we used SSRS on top of SSAS cube to generate a report. We used a horizontal bar chart to visualize higher or lower video sales during the years 1989-1995.

Q3. What is the profit trend of cheese during 1991 to 1995?

Report generated from SSRS alone

We used SSRS only to answer this business question. We used the product name from Product dimension, Years from 1991-1995 from the Time dimension and mapped them with the product Sales fact table to get the product sales. The sales from the fact table will be the trend of Cheese sales during 1991 to 1995. We have used SQL query and SSRS to generate the report for this business question. We have made use of bar chart to show the trend.

Q4. How the trend of grocery sales varies across different stores in Chicago?

Report generated from Report Builder 3.0

In order to answer this business question, we have used category name a GROCERY from category dimension, Store city as Chicago from Store dimension, Store number from Store dimension, year from time dimension and mapped them with the Category Sales fact table to get

the category sales. This will give the trend of grocery sales across different stores in Chicago. We have used two pie charts for this question- one showing the percentage of grocery sales across stores in Chicago and the other showing Dollar value of grocery sales across stores in Chicago.

Q5. Detect trends in Beer Sales encompassing the entire duration that look for high period of sales. Detect peaks not only during designated holidays but also on events that are not in the Week_Decode table.

Analysis of the cube created from SSAS only

We used SSAS only to answer this business question. We deployed a cube which consists of year and month from time dimension and mapped them with the Category Sales fact table to get the category sales. The Category Name was used as BEER from category dimension to group the category sales. We used SSRS to analyze the cube. We made use of two bar charts to show the Beer sale trends- one shows the monthly beer sale trends and the other shows the beer sales by year and month.

5.1.2 Mappings from the independent data marts to the report attributes

Q1 How are the sales of Bakery products affected during Christmas period over the period 1989 -1996?

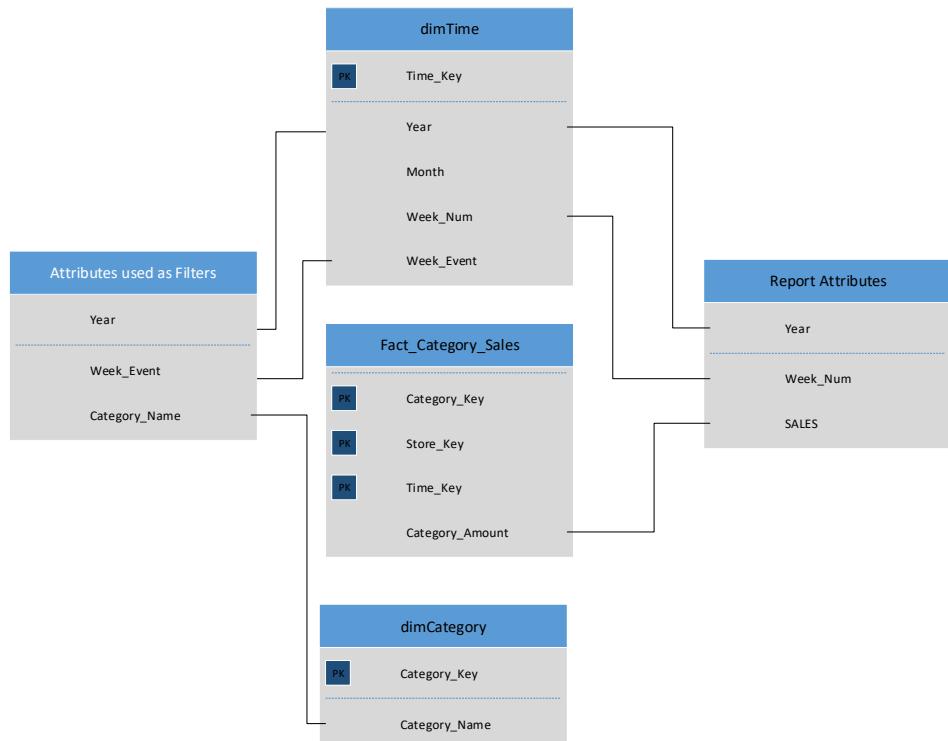

Figure 5.1-1: Data Mapping for Business Question 1

Q2 Are there any periods during the years 1989-1995 where the video sales are higher or lower?

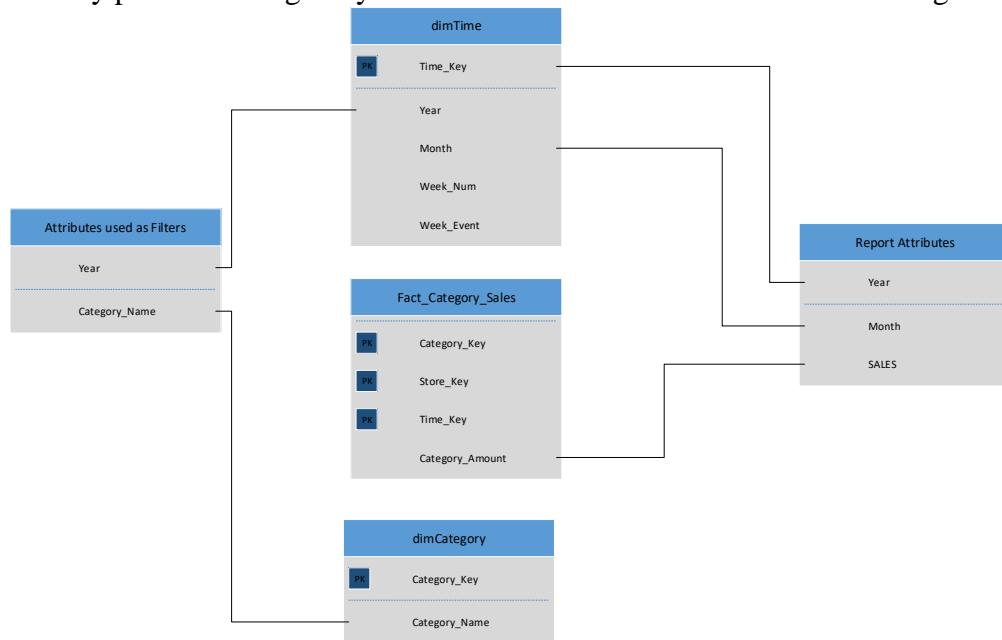

Figure 5.1-2: Data Mapping for Business Question

Q3 What is the profit trend of cheese during 1991 to 1995?

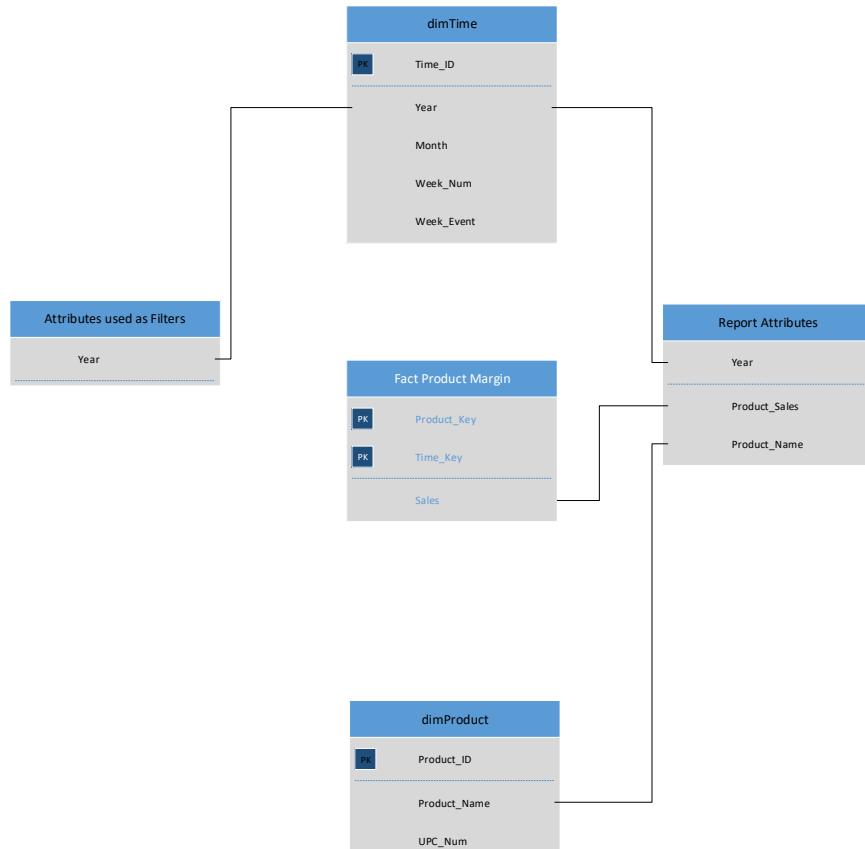

Figure 5.1-3: Data Mapping for Business Question 3

Q4 How the trend of grocery sales varies across different stores in Chicago?

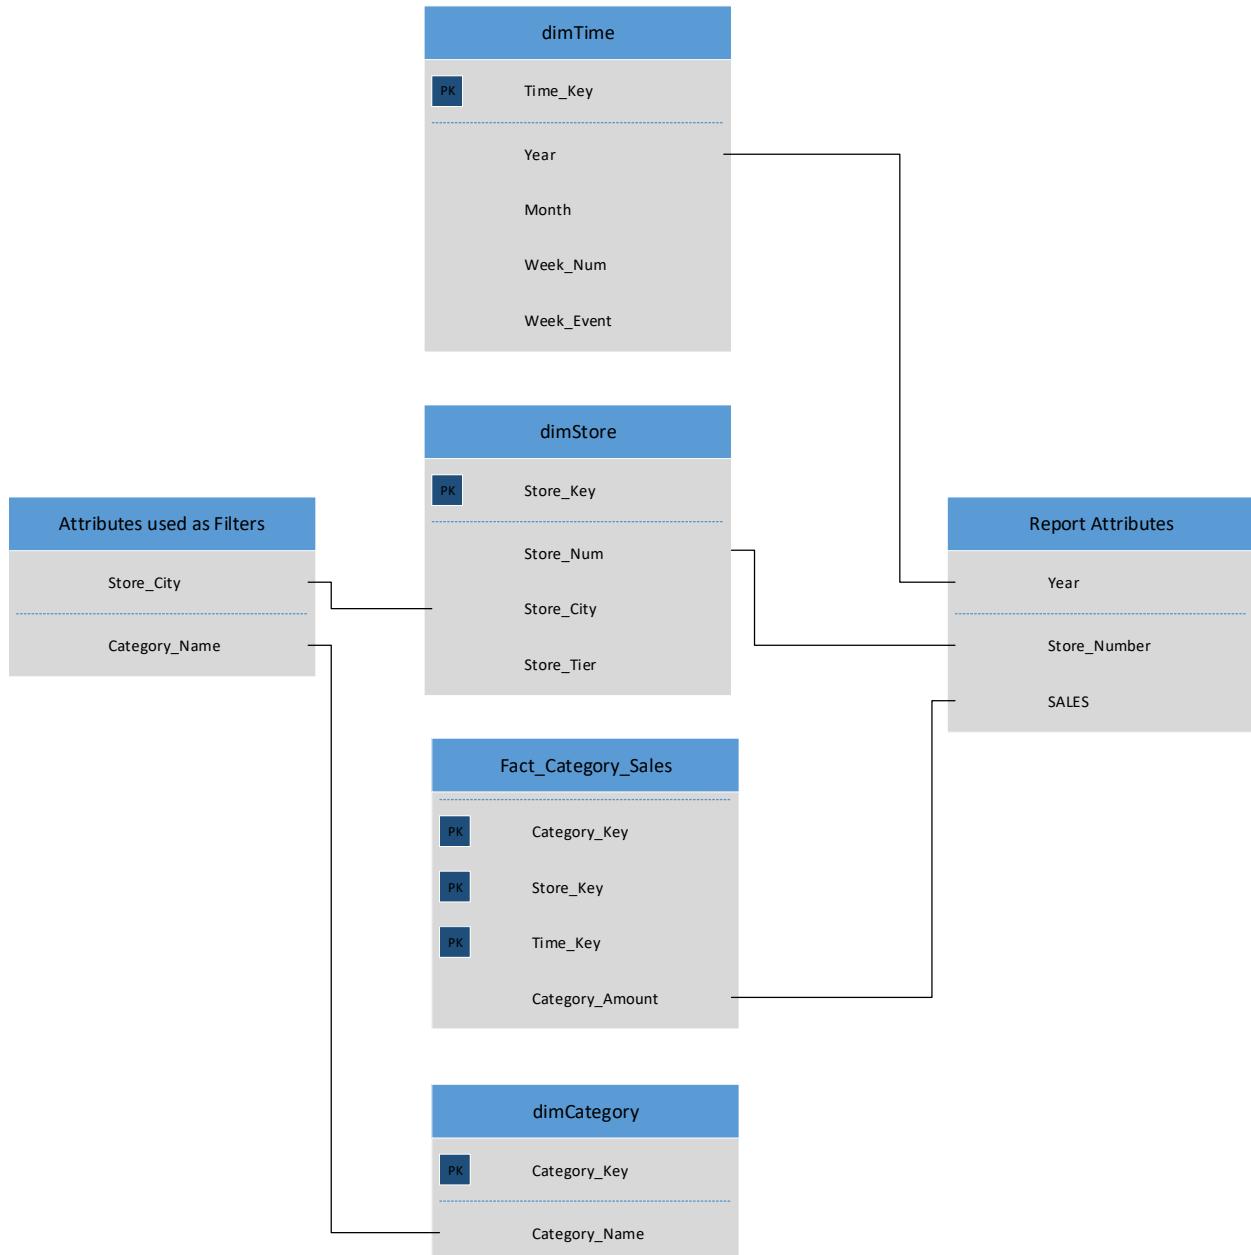

Figure 5.1-4: Data Mapping for Business Question 5

Q5 Detect trends in Beer Sales encompassing the entire duration that look for high period of sales. Detect peaks not only during designated holidays but also on events that are not in the Week_Decode table.

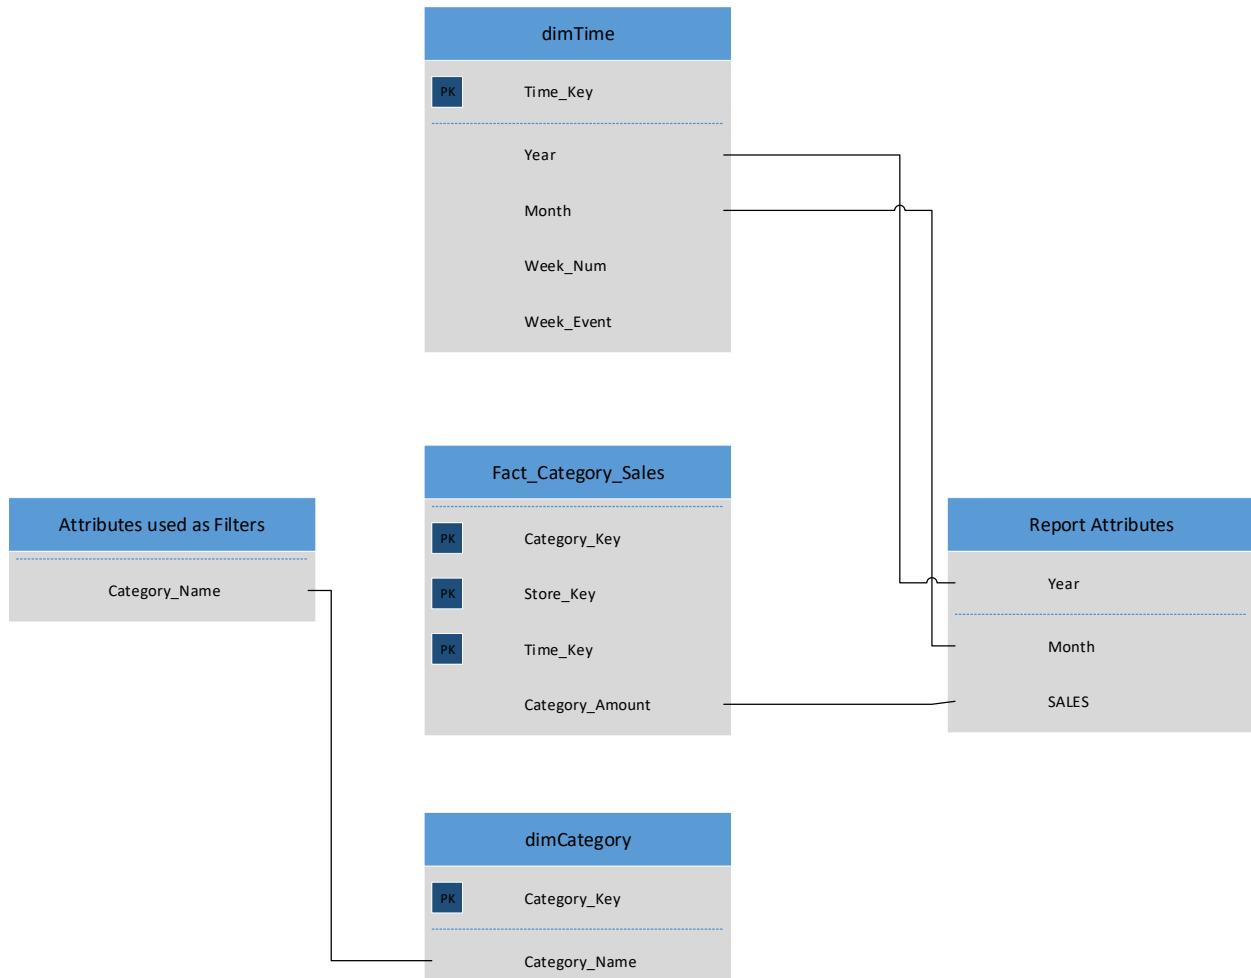

Figure 5.1-5: Data Mapping for Business Question 5

5.1.3 Report Templates

Q1. How are the sales of Bakery products affected during Christmas period over the period 1988-1996?

We will generate a horizontal bar chart for Bakery Sales during Christmas over the period 1989 – 1996. This report will be created in Report Builder.

Q2. Are there any periods during the years 1989-1995 where the video sales are higher or lower? We will generate a vertical bar chart for Video Sales which will depict the breakdown of video sales on monthly basis during the period 1989-1995. This will be augmented by a report with drilldown available on year and month basis for actual sales. This report will be created through SSRS on top of SSAS.

Q3. What is the profit trend of cheese during 1991 to 1995?

A horizontal bar chart will be generated to understand cheese profit trend from 1991 to 1995. This chart will be augmented by a report will drilldown enabled on Product Name, Year for Product Profit. This report will be created through SSRS.

Q4. How the trend of grocery sales varies across different stores in Chicago?

Report builder will be used to generate two pie charts that will depict the share of each store in sales. One pie chart will depict the percentage sales of each store vs total sales and another pie chart will show amount of sales done by each store to understand its overall sales.

Q5. Detect trends in Beer Sales encompassing the entire duration that look for high period of sales. Detect peaks not only during designated holidays but also on events that are not in the Week_Decode table.

SSAS will used to generate trend for beer sales on monthly and yearly basis which will assist in pointing out all the peak periods for Beer Sales in the past.

5.1.4 Reporting Tools

In order to create reports for answering the business questions, we have employed reporting tools such as SSRS, SSAS, a combination of SSAS and SSRS as well as Report Builder 3.0 with the following breakdown for each of the business questions:

| <i>Business Question</i> | <i>Reporting Tool Employed</i> |
|---------------------------------|---------------------------------------|
| Question 1 | Report Builder 3.0 |
| Question 2 | SSRS on SSAS |
| Question 3 | SSRS |
| Question 4 | Report Builder 3.0 |
| Question 5 | SSAS |

6. Report Deployed on Report Server

Figure 5.2-9: Report Deployed on Report Server

Conclusion

We used Report Builder to answer Question 1. Our aim was to find if there was any trend in bakery sales during Christmas over the period 1989 to 1996. The graph for Bakery Sales during Christmas

shows that there is an increasing trend in bakery sales during Christmas period. Consumers are now purchasing more and more bakery products from these retail stores. This information is useful as managers can safely assume that the trend i.e. increase in bakery sales will continue in 1997 too, in absence of any isolated or unlikely event, as the sales have increased continuously for the past 4 years. Business managers can utilize this information to take decisions such as to introduce new bakery products, increase bakery production of existing products etc. Such a decision will help business managers to tap into growth of bakery sales by considering results of this business question. This graph also emphasizes the importance of stocking up on bakery inventory during the Christmas week. Seeing an increasing trend in the sales of bakery products, business managers might want to stock up more inventory of bakery products prior to Christmas week.

5.2.2 Report from Cubes using SSRS and SSAS: Business Question 2

Question: Are there any periods during the years 1989-1995 where the video sales are higher or lower?

Reporting tool employed: SSRS on SSAS

9. Deployed Report on Report Server

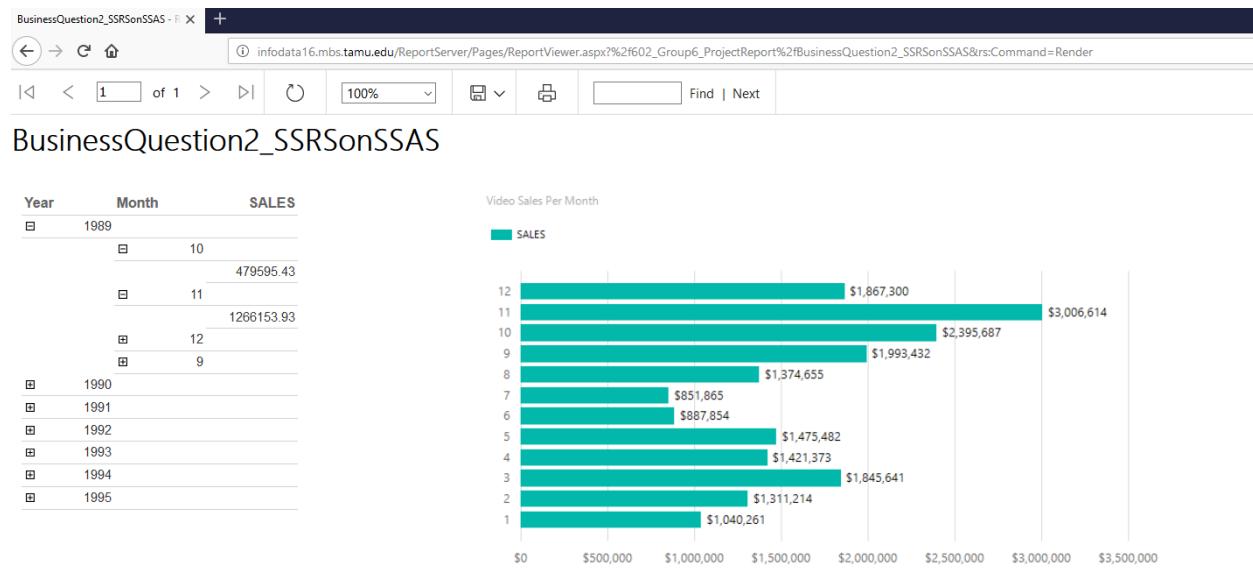

Figure 5.2-35: Deployed Report on Report Server

Conclusion

We used SSRS on top of SSAS to understand the trend for video sales. We constructed a hyper cube and then derived insights on monthly sales of videos. This analysis will help business manager understand what the periods are where customers purchase videos. Videos were a novel technology during the period 1989 -1995. The graph for video sales per month helps us understand that videos were being purchased a lot during the months of November, October and March where their sale was lowest during the months of June and July. Business Managers can look at this data to make a decision whether to stock up on videos or use the shelf space for other products. This analysis points out that videos must be stocked up during the months of November, October and March while during June and July shelf space allotted to them must be reduced.

5.2.3 Report from Independent Data Marts using SSRS: Business Question 3

What is the profit trend of cheese during 1991 to 1995?

Reporting tool employed: SSRS

Screenshots of report building

7. Deploy Report on Report Server

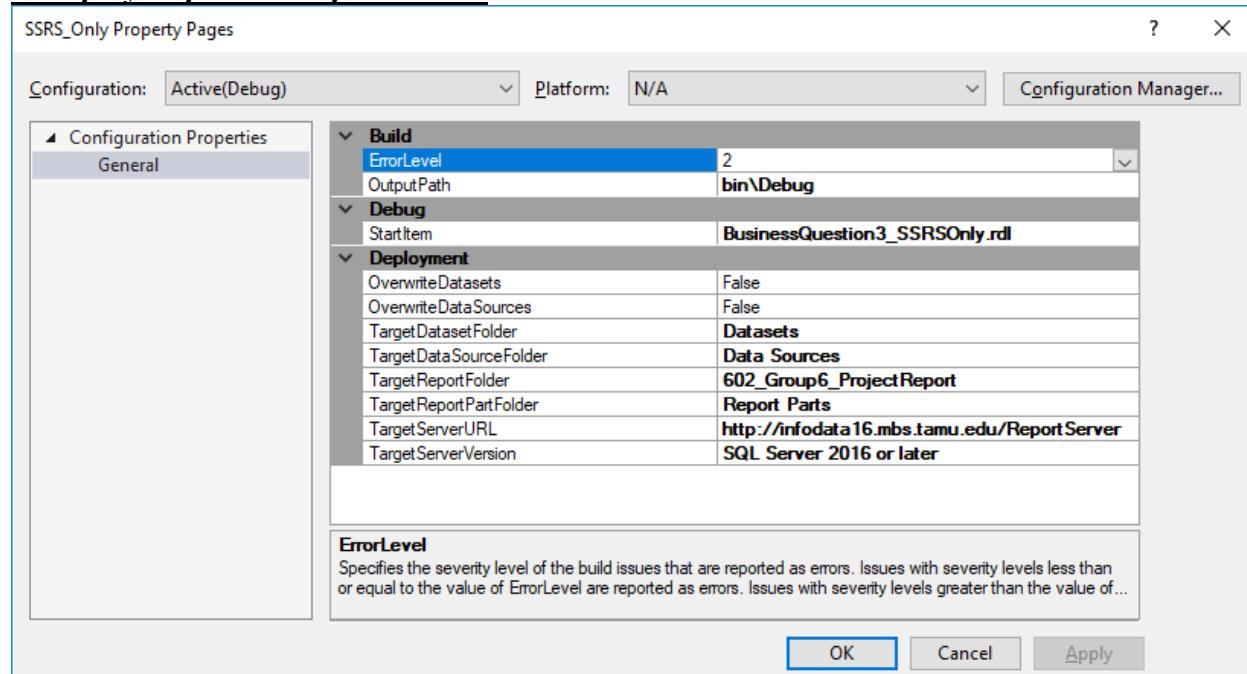

Figure 5.2-44: Deploy Report on Report Server

6. Report Deployed on Report Server

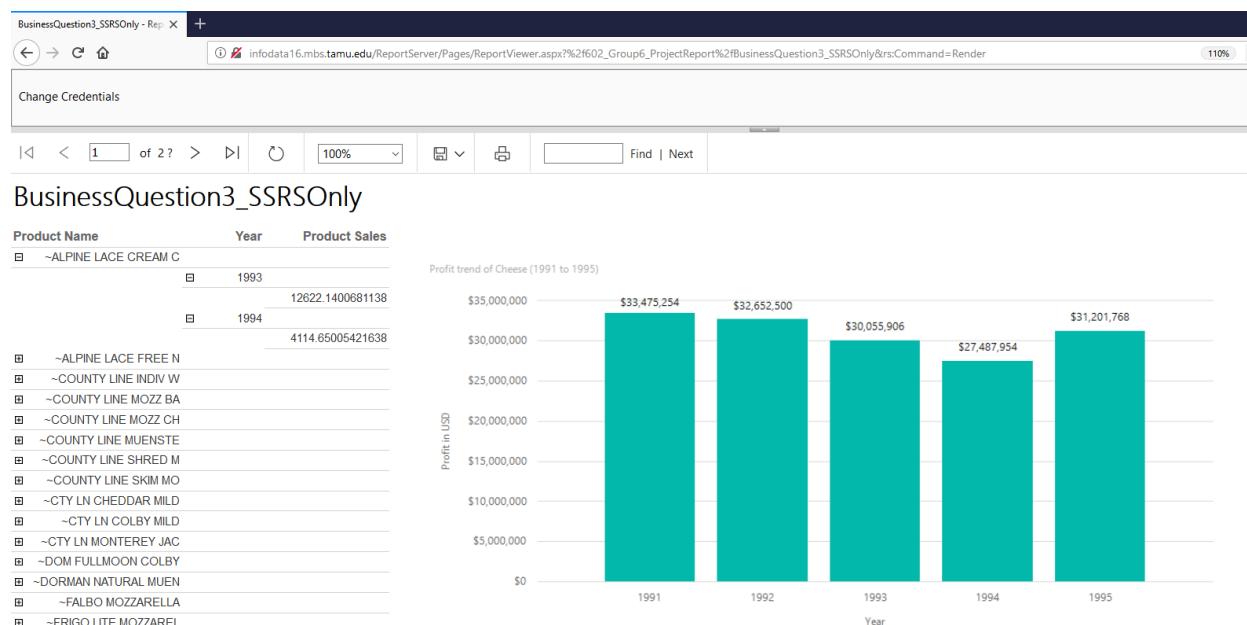

Figure 5.2-45: Report Deployed on Report Server

Conclusion

We used SSRS only to understand profit trend of cheese products from the period 1991 to 1995. We created a report with product names and their yearly profit and augmented it visually through a horizontal bar chart. From the report and corresponding chart Business Managers can understand that cheese sales have been dropping during the period 1991 to 1994. However, there is an increase in the profit margins during 1995. A business manager can utilize the report we have created to understand which cheese products profitable and selling and which ones are not. The ones which are generated high profits can be stocked more while the ones that are not profitable should be removed from the retail stores shelf.

5.2.4 Report using Report Builder: Business Question 4

How the trend of grocery sales varies across different stores in Chicago?

Reporting tool employed: Report Builder 3.0

Screenshots of report building

1. Create Data Source

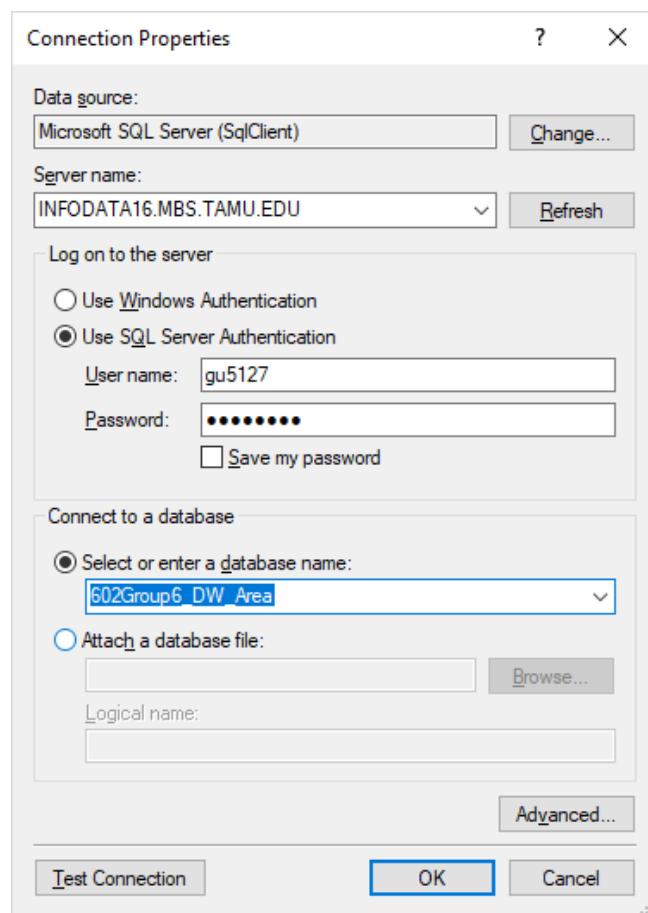

Figure 5.2-46: Connecting to database

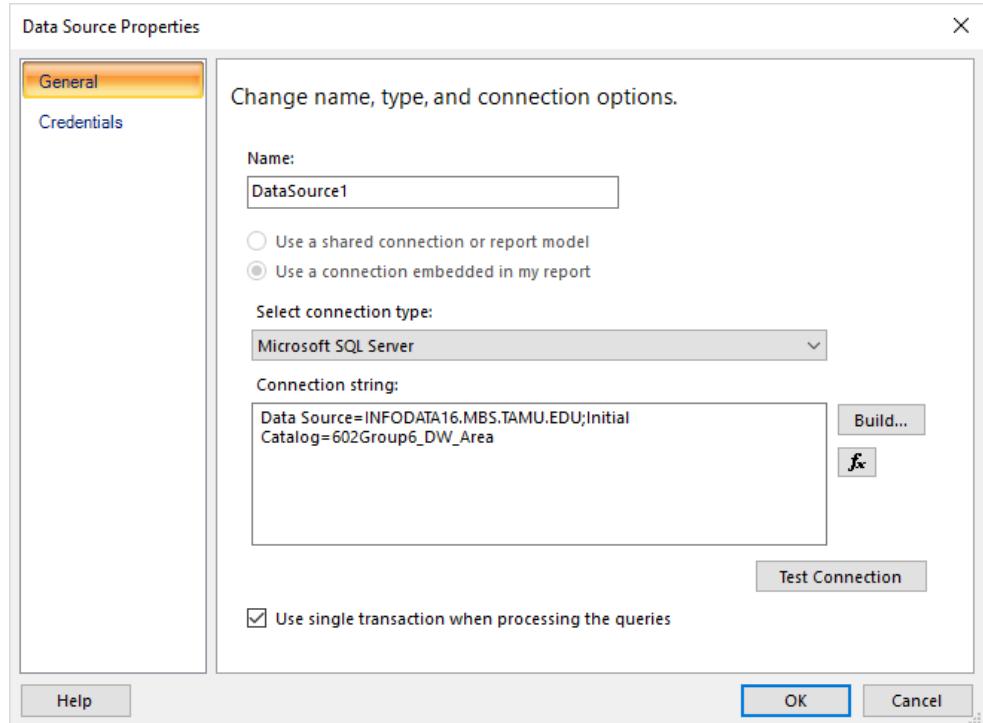

Figure 5.2-47: Data source properties

2. Design Query

| Store_Num | Year | SALES |
|-----------|------|--------------|
| 12 | 1989 | 141550.33000 |
| 33 | 1989 | 109277.73000 |
| 53 | 1989 | 126228.59000 |
| 68 | 1989 | 96524.43000 |
| 73 | 1989 | 217293.74000 |
| 75 | 1989 | 106089.03000 |

Figure 5.2-48: Designing Query

3. Arrange Report Fields

5. Report Preview in Report Builder

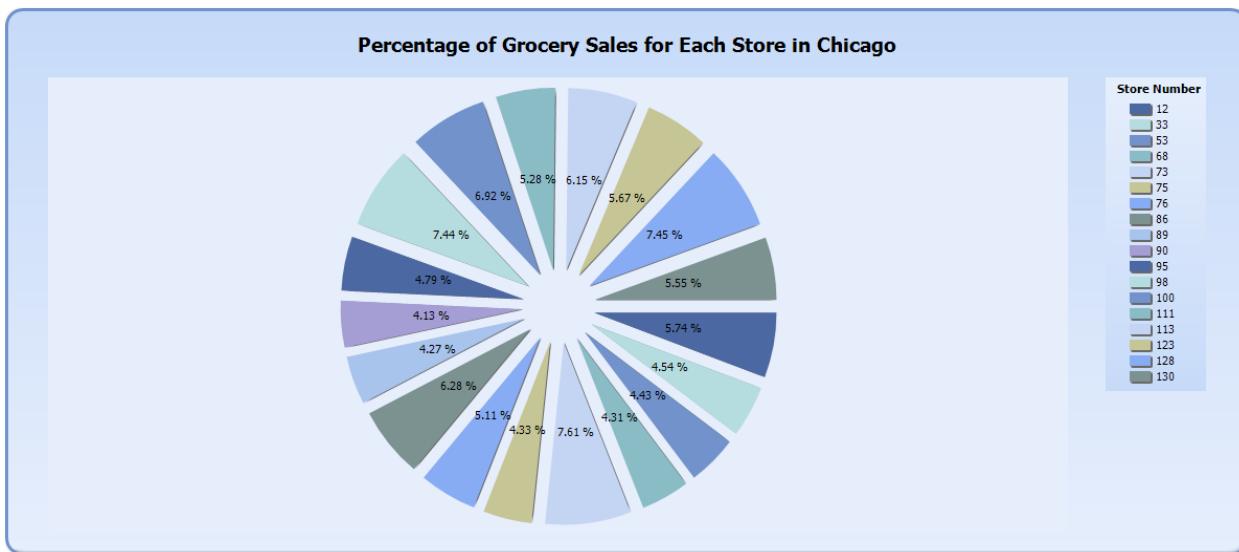

Figure 5.2-52: Percentage of grocery sales for each store in Chicago

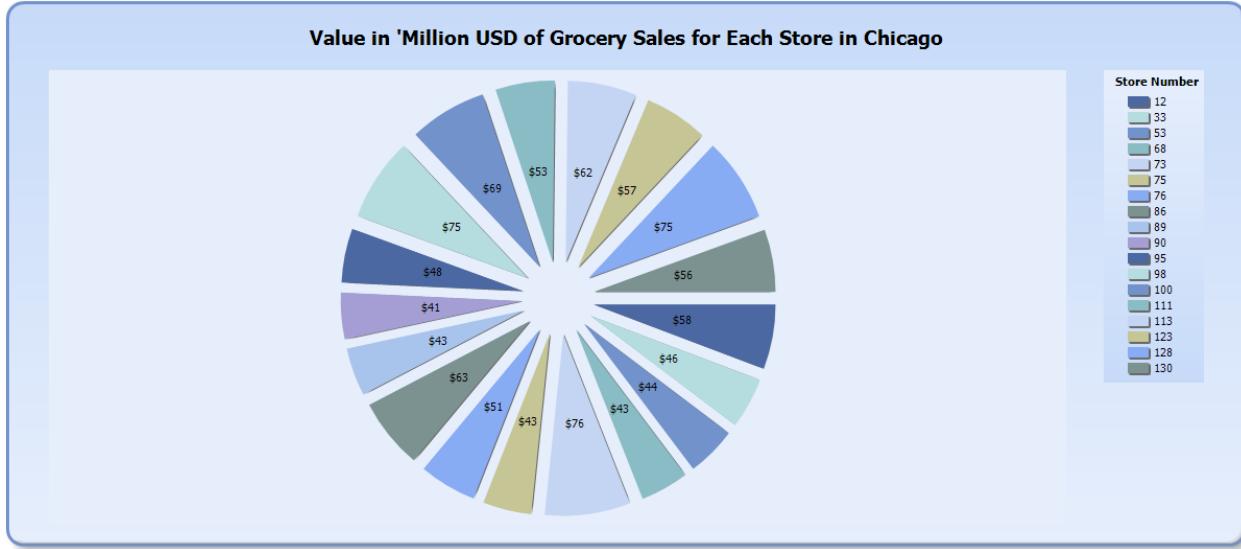

Figure 5.2-53: Dollar value of grocery sales for each store

6. Report Deployed on Report Server

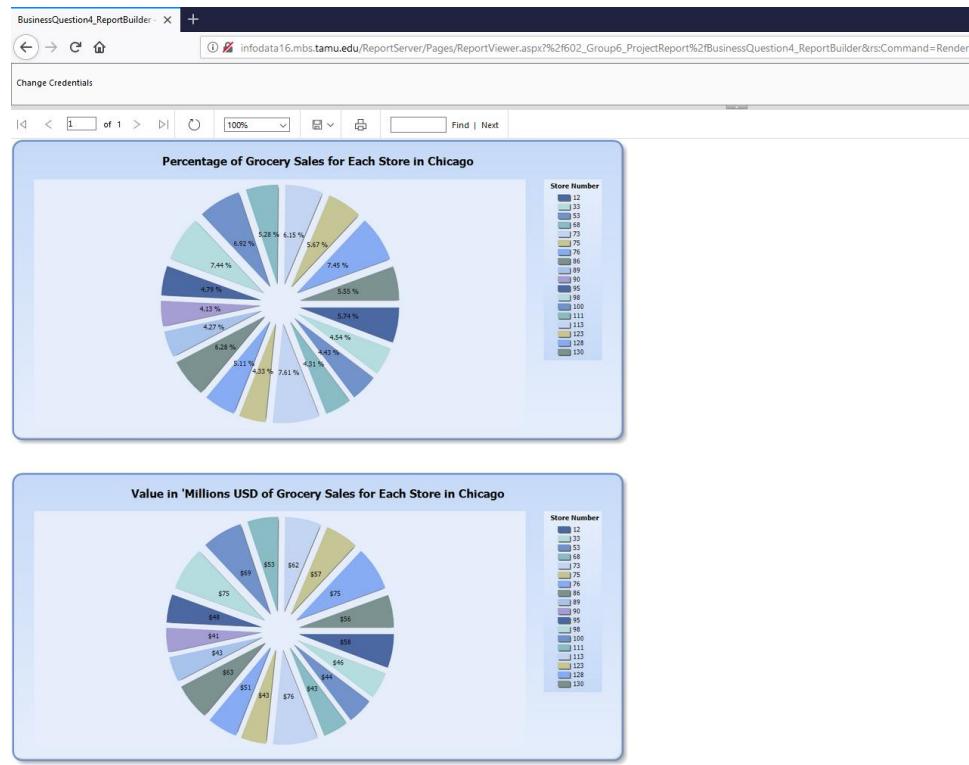

Figure 5.2-54: Report Deployed on Report Server

Conclusion

We used Report Builder to analyze the sales of grocery products across stores. We created two pie charts – one that shows percentage of total grocery sales of a store and another which depicts the exact amount of grocery sales per store. These two pie charts provide important insights to

Business Managers on how much is each store contributing to overall grocery sales and how much is the total amount of sales. These two measures can be used by business managers to stock up or remove stock from retail stores. For example, if a store contributes to less than 4.5% of overall sales and its total contribution is less than \$42mn a manager can decide to stock less grocery inventory in that store. But if the percentage grocery sales is less than 4.5% but sales are higher than \$42mn it would still be an important store for grocery inventory stocking. This analysis will assist a business manager in such kind of decisions.

5.2.5 Cube from SSAS: Business Question 5

Detect trends in Beer Sales encompassing the entire duration that look for high period of sales. Detect peaks not only during designated holidays but also on events that are not in the Week_Decode table.

Reporting tool employed: SSAS

Conclusion

We used SSAS only to detect the trends in BEER sale over the special events throughout the year. We created two bar charts to show the Beer sale trends- one shows the monthly beer sale trends and the other shows the beer sales by year and month. These bar charts will help the Business managers to understand which special events cause a rise in the sale of beer. The graph of monthly beer sale indicates that beer sales are high during July and December. On further analysis of the week numbers, we figured that beer sales were high during 4th of July and Christmas week. The graph of beer sales by year and month shows that the trend remains pretty much same with higher sales during July and December. This analysis shows that beer must be stocked up during 4th of July and Christmas week.
